82. Temporary stairways shall not be constructed at an agle exceeding seventy-five degrees with the horizontal.

83. Temporary stairways shall be substantially built of sound material and shall be provided with hand rails on all open sides. Landings shall be planked solid.

Temporary Floors

84. All temporary floors shall be of such construction as to carry a live load of 50 pounds per square foot with a factor of safety of two. Planks shall be placed closely together and not extend beyond the supports unless securely fastened to prevent tipping or properly railed off.

85. Buildings of reinforced concrete construction with reinforced concrete floors, shall have the floor filled in with either forms of concrete on each floor before the commencement of work upon the walls of the second floor.

86. If the building is of frame construction and if beams are not spaced more than 2 feet on centers, temporary floor shall not be required.

87. A temporary floor as specified in paragraph 84 shall be laid within three floors of the riveters and within five floors of the erectors in the immediate vicinity of riveters and erectors except stair openings and openings used for hoisting material.

Cables

88. Wire rope or cable shall be of adequate strength to support the load it is intended to carry and single strands shall provide a factor of safety of not less than ten.

89. Guard against chafing where cables run through floors or against steel work or other objects.

90. Cable shall be securely fastened to thrustouts.

Hemp Rope

91. Wherever hemp rope is used it shall be of first grade, long fibre manila hemp.

92. Rope when used for hoisting shall not be used to support loads in excess of 1/10 of ultimate breaking point.

93. Supporting ropes shall be double lashed at each point of suspension.

94. Where supporting ropes are brought over sharp corners of steel, stone or other material liable to cut the rope or in any other way subject to abrasion, they shall be protected at such points by the use of bagging, wooden blocks or other protective padding.

95. Rope knots shall have their loose and free ends lashed to the standing part of body of rope in order to prevent their becoming untied.

96. Rope badly frayed, rotted, or having been damaged by the action of acid or caustic or otherwise defective and unsafe shall not be used.

97. Spreaders shall be used when there is a danger of sling ends or hitchers slipping together.

98. Slings shall be protected with pads or blocks when wrapped around material with sharp edges.

99. Slings shall not be used in single slipnoose form.

100. Hemp rope shall not be used as slings for handling objects contaminated with acid.

101. Hand ropes (guide ropes) shall not be attached to slings but to hoisting tackle, and only when necessary attached to the object handled.

102. Defective slings should be discarded in order to avoid possibility of their being used by mistake.

Guys

103. Guy wires and ropes shall be of sufficient strength to carry the load imposed upon them and shall be securely fastened in place.

104. If wire rope is used it shall not support loads in excess of one-fifth its ultimate breaking load.

105. If hemp rope is used it shall not support loads in excess of one-fifth its ultimate breaking load.

Blocks

106. Blocks shall be of substantial construction and maintained in good condition while in use.

107. Blocks shall fit the size of ropes they carry and shall not chafe or abrade the ropes running through them.

Chain

108. Chains should be carefully in-

spected at frequent intervals. Watch for small flaws and cracks.

109. Avoid kinks. Chains break when kinks straighten out under a load.

Slings

110. Slings shall be of sufficient strength to support the load they are intended to carry.

111. When slings are made from cable or rope the ends shall be properly spliced to form the loop and loops should be lined with a properly formed metal thimble or otherwise protected.

112. Chain slings are dangerous and should be handled only by men of wide experience.

Electrical Installation

113. Temporary electrical installation need not be enclosed in conduits if adequate protection is otherwise provided to safeguard workmen.

Oxy-Acetylene Cutting Apparatus

114. Oxy-Acetylene flame cutting should be done by experienced men.

115. Tanks containing oxygen under pressure should be handled with care. Tanks should not be dropped nor should they be exposed to the direct rays of sun or high temperature from other sources.

116. Colored glass goggles should be worn by the operator.

117. Only cylinders which comply with Interstate Commerce Commission Shipping Container Specifications shall be used.

Cleaning Up

118. Rubbish and old material should be removed from the building and premises as fast as accumulated.

119. Rubbish and debris are useless material and are a source of hazard. Men often stumble over loose planking, brick, tools, rubbish, etc., and it is advisable to keep stairways and passageways free from obstruction.

120. Protruding nails are a source of accidents. Do not permit boards with protruding nails to lie around the job.

—*Building Industry.*

FALLACIES OF HEATING APPLICATION TO DRY OUT PLASTER

By. Professor Henry Adams, M. Inst. C. E.

It must first be understood that air at any temperature can hold moisture, or vapor of water, in suspension, but the amount so held will depend upon the temperature; the warmer the air, the greater the amount of moisture it can contain, the maximum for any given temperature giving what is called "the saturation point," anything short of this, giving the relative humidity, which can be calculated as a certain "percentage of humidity." All air contains more or less moisture, and, whatever the actual amount a continued fall of temperature of the air will of necessity reach the saturation point, any further rendering the moisture visible, as fog, mist, or dew. The saturation point for any given temperature is therefore also the dew point. It frequently happens that while the general bulk of the air in a room is at a temperature far above its dew point for the continued moisture, if a tumbler of cold water be brought into the room, moisture or dew will be deposited on the outside, because the air in contact with the glass will have its temperature lowered below its dew point. Or, as another example, if the temperature suddenly rises after a spell of cold, damp weather, the varnished wallpaper in a house will be found covered with moisture, from exactly the same cause as brought the moisture on the glass. "Washing day" in an artisan's dwelling may show the same things from the same cause. When the temperature of the condensing surface rises above the dew point for the air in contact with it, the moisture gradually disappears.

Heat alone, without changing the air, cannot drive out or absorb moisture; it can only convert it into vapor, which remains where it was generated until carried away by a current of air. In a drying closet of a laundry, the actual amount of heat is a secondary consideration; the more important matter is, that a current of ordinary dry, clean air, should pass through, and carry with it the maximum amount of moisture—that is, it should pass out in a saturated condition. The heat applied has two duties to perform—first, by raising the temperature of the air, to increase its capacity for holding moisture, and secondly, by reducing the specific gravity of the air, due to its expansion, assist in causing its upward flow through the outlet ventilating flue, while the fresh air comes in below.

Drying Plaster

In drying the walls in a house newly plastered, it is customary to put a fire bucket on a course of bricks or a heap of sand in the middle of the room; the radiant heat from the fire warms the walls of the room so that the air in contact with them can hold a greater amount of moisture. Moist air is lighter than dry air, and rises; therefore, provision must be made for it getting away through the top of the window, while fresh air comes in at the bottom, or under the door.

There is another point to note in connection with the evaporation of moisture. It takes about five and one-half times the quantity of heat to evaporate a given quantity of water than it does to raise the same quantity of water to boiling point, so that the evaporation of water from the wall tends to cool the wall by the abstraction of heat and so reduce the efficiency. The walls may be most quickly heated by keeping the windows closed and the door shut. There will probably be sufficient air to keep the fire burning for an hour or two, and the window must then be opened at the top. Care must be taken in going into a closed room with a fire in the center that the carbon monoxide and carbon dioxide are not too strong for respiration, especially if a coke fire be used, so that if the top sash can be drawn down from the outside, it will be an advantage. These explanations ought to make the whole matter quite clear, the common fallacy being that heat is the only thing necessary to dry moisture out of any material.—*The Contractor.*

GOOD TIMES IMMEDIATELY AHEAD

Business Stimulated By Certainty of Better Conditions Foresighted Men Make Preparation for Coming Revival

Business is better.

The outlook for the summer is excellent.

Good times loom immediately ahead.

Analysis of reports from every part of the country gives a definite basis for the foregoing statements. These reports come, as shown by excerpts on the inside pages, from conservative authorities: *Bradstreet's*, the *Chicago Journal of Commerce*, the *National Bank of Commerce*, New York, *Commerce Monthly, Harvard Economic Service, The Annalist*, the *U. S. Industrial Employment Survey Bulletin*, the *U. S. Department of Commerce Bulletin* and *Moulton's Weekly Analysis.*

Fundamentally, what is back of this satisfactory business condition as seen by the financial publications? It is this: Business men are making money; their profits are increasing. Such is the affirmative statement of the *Harvard Economic Service* weekly letter of June 3. But what is back of these profits? Take a look at the spread of news heads on the second and third pages of this folder: Bumper crops; construction in all lines on the increase; steel mills turning down large orders; car loadings at highest peak; retail sales good, and as a result of all these factors a firm basis for trade revival is shown and the outlook is bright.

Farmers are hopeful and are placing orders for machinery and other supplies. In every big industrial center—New York, Chicago, Minneapolis, San Francisco—buildings of all kinds are being constructed, giving work to thousands who, until recently, had been idle; and this boom in building causes a demand for basic materials such as steel, lumber, cement, sand, etc., thus giving employment to thousands of others who lately have been unemployed. Production in the automobile industry this year has al-

ready passed the million mark, and in other industries there is a similar trend upward. Telephone companies are expanding; oil prices are better; and the insurance business, which is more and more coming to be considered a business barometer, shows a net gain of $128,000,000 for 1922. All in all, business may be said to have "turned the corner" and to be out on a straight road going steadily forward.

To the man who studies the signs of the times this points to one conclusion: Right now is the time to be on the jump—to develop new business, to make new sales and to qualify for and fill new executive, accounting, sales and office positions— now, when the trend of business is on the move upward—not some distance in the future when the work has settled down to a steady grind and the high peak has again been reached.

—*Business Bulletin.*

REMOVAL NOTICE

Gehret Bros. Inc., Structural Steel and Ornamental Iron Work, plant at Bridgeport, Pa., have discontinued their Philadelphia office, 306 Perry Building. Mr. B. M. Christman has been transferred to the plant office. All future inquiries and general correspondence should be forwarded to the plant at Bridgeport, Pa.

Manufacturers of fire-resistive materials and of fire-fighting and retarding apparatus, for the first time, will have the opportunity of taking part in a Fire Prevention Exposition to be held October 2 to 7 at the Twenty-second Regiment Armory, New York City, where will be shown, by exhibit and demonstration, what a vital part in the fight against the great annual fire loss is played by fire-safe materials and apparatus.

The Exposition originated with the Fire Prevention Committee of the National Association of Insurance Agents as part of its program of fire prevention activities. It has been endorsed by the National Fire Protection Association, the National Association of Credit Men, by President Frank G. Reynolds of the International Association of Fire Engineers, the National Board of Fire Underwriters and other associations.

The problem of reducing the terrific strain on business caused by preventable fires, that seem to be increasing each year, is one that has long engaged the attention of these organizations. At the present rate of burning, property worth $1,300,000 is being destroyed each day. This is a financial burden which is borne by business men, for the fire insurance companies, contrary to general belief, do not bear this loss—they simply pay out $1,300,000 each day that has been paid in to them in premiums by the public.

So great has the strain on business become that on June 26, this year, at the request of these organizations, Governor Richie, of Maryland, called a conference of the Governors of New York, New Jersey, Maryland and Virginia. This conference adopted a motion to present the matter of fire waste and conservation to the Chamber of Commerce of the United States and on July 12 a conference of representatives of the four associations named above and of the American Institute of Electrical Engineers, Railway Fire Protective Association, American Institute of Architects, American Society of Mechanical Engineers and of the Boy Scouts of America was held at Washington.

At the Washington Conference the Chamber of Commerce of the United States was asked to undertake the responsibility of educating organized business men to the huge annual tax caused by fires. President Barnes of the Chamber accepted this responsibility and plans are now under way for a national citizen's fire prevention campaign.

The peak of this year's effort will be reached during National Fire Prevention Week, October 2 to 7, and the First Fire Prevention Exposition will be its greatest educational feature. It is purposed to show, by means of the Exposition, the latest ideas in fire-safe construction and also to demonstrate to the public the proper appliances to be used in fighting and preventing fires.

A lecture hall is in the armory building and it is planned to make each day of the Exposition a special day, with lectures and motion pictures in the lecture hall. One day will probably be devoted to municipal authorities and fire department officials, with addresses on municipal fire prevention and protection. Motion pictures illustrating these will be shown. Another day will be given over to the children, who will be shown what they can do toward helping reduce the fire loss. A third day will be for plant managers and executives, who will be shown the hazards of industrial plants and told how these can be eliminated.

HARD FACTS ABOUT CONCRETE

DO YOU KNOW—That no other single factor has so great an effect upon the strength of concrete as has the amount of water used?

Thousands of tests conducted at the Structural Materials Research Laboratory, Lewis Institute, Chicago, prove that a direct relation exists between the quantity of water used in mixing concrete and the strength of the resulting concrete. *These tests mean money to the builder because strength is what he is after.*

A variation of ten per cent. above or below the correct amount of mixing water may reduce the strength of the concrete by thirty per cent. or more. The very wet, sloppy mixtures that are sometimes used in building construction result in a loss in many instances of from fifty to sixty per cent. of the possible strength of the building.

Within the range of plastic mixtures, the strength falls off rapidly with the addition of a small amount of superfluous water; in a one-bag batch the addition of even one pint of water more than is necessary to give a workable mix results in the same loss of strength as if from two or three pounds of cement were left out of the mixture. *Thats money out of the pocket for the builder.*

The exact amount of water required for any particular mixture of aggregates to obtain the greatest strength in the concrete can be determined, only by actual test. Workability of the mixture is important and must not be sacrificed. As a basis for trial with well-graded aggregates up to 1½ inches in size, and a 1:2:4 mix, use 6 to 6½ gallons of water per sack of cement. For a 1:2:3 mix begin with 5¾ to 6 gallons, and for a 1:1½:3 mix, 5½ to 6 gallons. *Remember: Use the least amount of water that will give a workable mixture.—Concrete Builder.*

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

MATERIALS, THE FUEL OF CONSTRUCTION

Protest Government Orders Which Mean Shut-down of 80 Per Cent. of All Construction Work East of Mississippi As Soon As Coal Strike is Settled

Orders issued by the Interstate Commerce Commission July 25 and amended on August 4, giving demand for open-top cars for coal for *any* purposes over requests for open-top cars for other purposes will probably mean a shut-down of four-fifths of the construction projects under way east of the Mississippi River as soon as the coal strike is settled unless the order is modified before that time. In this order the Commission establishes five classes of coal which shall have priority in the following order:

1. Coal for special purposes designated by the commissioner or its agent.
2. Coal for transportation, public utilities, Government institutions, domestic use.
3. Coal consigned to Lake Erie ports for trans-shipment to ports on Lake Superior.
4. Coal for manufacture of food-stuffs, and medicines, and containers therefor.
5. Coal for other purposes.

What this means for construction is best expressed in the following petition which has been submitted to the Commission by the Associated General Contractors of America.

Augut 5, 1922.

The Honorable,
The Interstate Commerce Commission,
Washington, D. C.

Gentlemen:

This petition of the Associated General Contractors of America respectfully shows that—

1. Your petitioner is the representative of approximately fifteen hundred of the principal general construction contractors of the United States and is vitally interested in the entire construction industry, both in construction work proper and the manufacture, production and transportation of construction materials.

2. There are at the present time actively engaged in actual construction work, east of the Mississppi River, over 1,300,000 men on projects now in process of contruction of the total value of approximately $1,700,000,000; that there are actively engaged in supplying construction material to carry on these projects approximately 1,500,000 men; so that the uninterrupted continuance of this industry is vital to the lives of 2,-800,000 workers, and of course to their families whom they support. It can be fairly stated that over 11,000,000 people are dependent for their daily support upon the wages of these workers in the entire construction field east of the Mississippi River.

3. The construction program now in progress is largely directed to relieving the acute housing shortage in the United States and through the construction of highways to making more accesible outlying districts which in turn has its effect on both housing and costs of living. Any radical interruption in that industry at this time, therefore, will have a far-reaching effect upon the health and comfort of the whole people.

4. The construction industry, as is well known, is largely seasonal. To interrupt the program which is now at its peak in the construction field at this time, even for a few weeks, would so disarrange the program as practically to throw over into another year many of the vital projects now under way, resulting in enormous losses.

5. The order issued by your Honorable Commission under date of July 25, being known as Service Order No. 23, provides, in effect, that all of the cars suitable for the loading and transportation of coal, which includes practically 90 per cent. of the open top cars of the country, shall be used exclusively if demanded for the transportation of coal for all purposes, not only those of emergent necessity for which priority rating is given by your Commission, in numbers 1, 2, 3 and 4 in said Order, but also of coal for all other purposes.

6. Recognizing that it is the purpose of the Commission to supply fuel to the

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 3519

BLUE PRINTS

essential industries of the country with the least possible interruption to the general business of the country, we believe that Service Order No. 23 fails to take cognizance of the far-reaching effect it will have upon the transportation of construction material, nearly all of which is transported in open top cars. Service Order No. 23 will, in effect, withdraw nearly all open top transportation facilities from the construction field as soon as the mines are opened. This will mean the immediate shut-down of an industry which furnishes the livelihood of 11,000,000 people, as has been pointed out. It is respectfully submitted that an order intended to insure fuel delivery to keep industry going, but which is so drastic as to practically stop the operation of the second largest industry in the country, not only defeats its own purpose but only makes matters worse.

7. With the reopening of the mines the demand for cars for coal loading will be not less than 320,444 cars per week, which number can actually be loaded with coal if available.

The maximum number of open top cars of all kinds which the railroads can supply, taking into account the present large number of unserviceable cars, will be 324,000 cars per week, of which only 291,000 will be suitable for the loading and transportation of coal, leaving, under the operation of the Order, only 33,000 open top cars for all other purposes.

That weekly rquirements for such cars for the transportation of other commodities will be:

	Cars.
Construction materials	85,000
Ore	40,000
Limestone	10,000
Coke	10,000
Miscellaneous	10,000
Total	155,000

This leaves available for all purposes other than the transportation of coal only 21 per cent. of the number of cars needed, and these very largely cars unsuited for carrying the commodities for which they will be wanted.

8. We fully recognize the fact that the general welfare of the country will be promoted by giving preference to the transportation of fuel for the first four priority classes enumerated in Service Order No. 23, but to give the transportation of fuel for all other purposes a priority over the transportation of all other commodities, and especially construction materials, upon which 11,000,000 of our people are dependent for their daily bread, will not carry out the purpose of the Commission and will have an effect which will disrupt the business of this country in a way that will work a hardship far beyond the requirement for the transportation of fuel for a general purpose after the necessary emergency purposes are met.

9. We desire to make the point that after the four necessary emergency cases are met, fuel should take a class along with other materials necessary for the normal business of the country. What fuel is to manufacturing, construction materials are to actual construction. *In a word, building materials are the fuel of construction.*

10. With the enormous demand for coal which will accompany the reopening of the mines, so few cars will be available for construction materials, under the terms of Service Order No. 23, that four-fifths of all construction projects east of the Mississippi River will be obliged to close down.

11. Your petitioner respectfully prays that Service Order No. 23 be amended so as to provide that after the railroads have supplied open-top equipment sufficient to carry the fuel required by the first four priority classes enumerated in said Order, that they be directed to supply open-top equipment without preference to all other commodities including coal.

12. If it would better serve the purpose of the Commission to permit construction materials to have a parity of classification with the fifth class of priority for fuel, then your petitioner prays that the said Service Order No. 23 be amended so as to direct such furnishing of open-top equipment to construction materials by the carriers.

13. If the Commission desires further facts along the line of those stated above in this petition, your petitioner stands ready to answer its call and to furnish all data in its possession.

14. Your petitioner respectfully prays an opportunity to be heard in support of the prayer of this petition.

Respectfully submitted,
ASSOCIATED GENERAL CONTRACTORS OF AMERICA,
By: R. C. MARSHALL, Jr.,
General Manager.

Waterproofed with
Trus Con Waterproofing Paste

Trus Con Waterproofing Paste (Concentrated)

Is a scientific product, developed by our technical staff. It is used in practically all the large operations throughout the country. Mixed with the tempering water, it contributes powerful water repellent qualities, but does not weaken the concrete nor interfere with the normal development and setting of the cement.

Proposals

ADVERTISEMENT FOR POWER HOUSE TRENTON STATE NORMAL SCHOOL, TRENTON, NEW JERSEY

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct a Power House at the Trenton State Normal School will be received by the Architects at the office of the Commissioner of Education, State House, Trenton, N. J., on Sept. 7th, 1922, at 3 P. M., Daylight Saving Time.

The work for which proposals are hereby invited covers the construction of a new Power House adjacent to the present Trenton State Normal School at Trenton, New Jersey.

The Power House will be 32 feet wide by 86 feet long with an underground pump and Coal Room Addition. The building will be of brick construction with steel and timber roof and steel sash. The building will house a High Pressure Steam Plant, Electric Generators, Refrigerator Plant, etc. The boilers will be connected up to an independent radical brick chimney stack.

Bids will be received for the work under four separate contracts as follows:

1. For General Construction, which includes all Masonry, Carpentry, Steel and Iron, Roofing, Painting and all work kindred thereto.
2. For Plumbing and all work kindred thereto.
3. For Heating, including Refrigerator Plant, Chimney Ash Conveyor, and oil burning system, and all work kindred thereto.
4. For Electrical Work including Generators and Switchboard.

The right is reserved to accept or reject any or all proposals and to waive informalities. All bids must be in sealed envelopes endorsed "Proposals for Power House State Normal School, Trenton, N. J.." and stating the branch of work covered. No bid will be considered unless accompanied by a certificate check to the order of the State of New Jersey, in the amount of 5% of the bid or bond in like amount binding the bidder to execute a contract if awarded to him. The terms of proposal with Surety required are fixed by the specifications.

Copies of the drawings and specifications will be on file at the office of the Architects for the purpose of estimating; a limited number of copies of the plans and specifications will be loaned to the prospective bidders on deposit of a certified check to the order of the State of New Jersey in the sum of $25.00. These plans may be obtained by application of Guilbert & Betelle, Architect, 546 Broad Street, Newark, N. J. If plans and specifications are returned on or before the submission of estimates the check will be returned, but should the plans and specifications be not returned, the deposit may become forfeited.

Dated: August 21, 1922.

GUILBERT & BETELLE,
ARNOLD H. MOSES,
Associate Architects.

(Continued from page 552)

fortunately, it is very seldom the case that a building is put up without some alterations or modifications of the plans, which involve a change in the contract price for the work, and there has been no standard practice in adjusting these differences, so far as we can determine. Therefore, your Committee has gone into the problem of trying to determine fair and equitable relations between contractor and owner where such changes are involved, and has formulated certain very definite recommendations.

Alterations or deviations from the original plans and specifications are a source of expense to the contractor, whether the change be in the nature of an omission or in the nature of an addition. All such changes are apt to interfere with the progress of the work, delay the completion of the work as a whole, cause the contractor additional expense on other work in progress on the job which is affected by the changes, and make demands not only on the contractor's field organization but upon his main office organization out of proportion to the amount of work involved. It is evident that there should be a charge to the owner for the services so rendered, regardless of whether the work is an addition or omission.

Recommendations

This leads to our first set of recommendations:

(a) That all charges for additional work take into account the contractor's overhead in addition to the actual cost of the work and the contractor's profit.

(b) That all omissions take the same items into account, and, to accomplish this end, we recommend that allowances for omissions be based upon the actual estimated cost of the work without any allowances for the contractor's estimated profit on the operation involved—it being our thought that such estimated profit should be retained by the contractor to compensate him for the additional expense involved in deviating from the original plans.

(c) Accurate written records should be kept and all transactions relative to changes should be confirmed in writing between the contractor and owner.

Interpreting Plans and Specifications

Where work is considered by the contractor as additional to his contract price, such additional work may arise from a disagreement as to the interpretation of the plans and specifications, or it may be an addition to the plans acknowledged by the owner.

We recommend:

(1) That all contractors prohibit their field organization from proceeding with any additional work to the contract, whether acknowledged or not by the owner, without specific instructions from the contractor's main office or his authorized representative.

(2) Where the contractor proceeds with work in dispute as to whether or not it is extra, it should be a matter of written record from the contractor to the owner as to the contentions involved and as to the basis on which the work is being done.

(3) Where there is no dispute involved, the work should only be done on the written authorization of the owner or his agent.

(4) An accurate record of all labor and materials used in connection with extra work should be kept on a separate extra work report sheet, with provision made thereon for the signature of the duly authorized agent of the owner directing the work to be done, and charged to the owner.

Lump Sum or Time and Material

Where work is performed additional to the contract, it may be handled in two ways. Either on a basis of an agreed lump sum charge or on a basis of time and material plus a percentage for contractor's profit.

We highly recommend that all work which can be intelligently priced and handled on a lump sum basis be so handled, and that the lump sum be agreed upon prior to the execution of the work, with proper acknowledgment of the work and amount involved.

Where it is impossible either through the nature of the work or the time element to definitely arrive at a lump sum price, we recommend that the work be performed on a time and material basis plus pecentage for contractor's profit.

Charges for Extra Work

In the absence of any definite agreement in the contract, we recommend that charges for extra work performed on a time and material basis be billed to the

owner in accordance with the following: *General Items of Cost.*

The general contractor shall be reimbursed in the manner hereinafter described for such of the actual expenditures in the performance of the work as are included in the following items:

(A) Wages of workmen, material, supplies, tools and appliances (as distinguished from machinery and equipment listed hereinafter), and cartage and freight required for the completion of the work in question, either as shown by the revised plans and specifications, or by written instructions, and for the installing, equipping, operating and dismantling of temporary works, plant, machinery and equipment, sheds, offices, commissary and hospital.

(B) Sub-contracts placed by owner or general contractor for material or labor or both.

(C) Rental, or its equivalent, beginning with shipment and concluding with arrival at return shipping point, at the rates set forth in attached schedule, for the general contractor's machinery and equipment, and rental actually paid by the contractor for other machinery and equipment, or parts thereof, as used in the prosecution of the work, cost of loading, unloading, shipping charges to and from the job, and ordinary repairs and replacements during use and shipment for all machinery and equipment. Rental on machinery and equipment in place at average rental and maintenance charge per schedule assigned by Associated General Contractors or general or main contract.

(D) Premiums for bonds and fire insurance, fee of Building Trades Employers' Association, expenditures for telegraph and telephone service, expressage, postage, field office supplies, permits, deposits, royalties, and other similar items incidental to the execution of the contract.

(E) Salaries of superintendents, foremen, engineers, timekeepers, clerks, expeditors, watchmen, waterboys, and all other employees in the field office of the general contractor to be pro-rated over the total number of workmen's hours daily and the proper proportion of the superintendent's, timekeeper's, watchmen's, waterboy's, etc., time charged to each item of extra work. If any of these men are giving an overdue amount of their time to any or all items of extra work then their exact time given to the extra work is to be charged.

(F) Salary allowance proportionate with time actually applied to this work for employees dividing their time between this and other work, transportation and incidental travelling charges to and from the work for the necessary field forces required in the economical and successful prosecution of the work in the procuring of labor, and in expediting production and transportation of material and equipment, and for other employees or officials of the general contractor actually incurred in connection with this work.

(G) Compensation, public liability and contingent insurance on all wages and salaries. We recommend a charge of seven per cent. of the payroll to cover these items, together with the uncovered risk.

(H) An allowance to compensate the contractor for his overhead expense. We recommend a charge of 10 per cent. on the total cost of work to the contractor to cover this item.

Credits to Owner

The owner shall receive from the general contractor the following credits:

(I) Rebates to the amount of 50 per cent. of the original billed price for all lumber and materials used in this work and delivered in good and serviceable condition to and accepted by the general contractor.

(II) Rebates to the amount of 50 per cent. of the original billed price for all perishable tools and appliances used in the work and upon completion of the contract returned in good and serviceable condition to and accepted by the general contractor.

(III) The full returned amount of any refundable deposit made and charged against this work.

To the sum of the items enumerated above, after proper credits have been given, a percentage is to be added for contractor's fee. We recommend a charge of 10 per cent. to cover this item.

GARDEN WALKS

How to Lay a Stone Path for Beauty and Service

BY H. ROGERS

Stone for paths and terraces is growing in favor with quite a number of home owners and therefore the builder is often called upon to construct such a walk and to aid him in this work the following remarks may be appreciated:

To make a good job the walk should have a proper foundation; a trench eight inches or more in depth should be made and filled in with some refuse material that will allow of quick drainage, broken stone or cinders are good but, if the building has just been completed, there will be more or less broken pieces of brick and stone lying around for removal; these can be buried for the path foundations at a saving at both ends, it gets rid of the rubbish and no material has to be purchased.

A stretched cord is the best means of keeping the lines of the path straight; for curved paths the radius is described with a cord fastened to a stake as a center.

If the garden is level it is best to give the path a slight camber to throw off the rain water but this is unnecessary if the ground slopes perceptibly across the line of the path, as then the path may be kept flat on the surface and made to continue the natural slope of the ground. To get the path level one should use a large straightedge; this is preferable to a cord which is likely to sag.

Little did England's old gardeners and our own Colonial forbears appreciate the beauty of their winding grass framed walks, made of stepping stones. There is a delightful absence of artificialness about such a path and that is the reason, perhaps, why they are being better appreciated by the people of today.

In localities where stone abounds the cost is but little for material. In other places it pays to buy the stone and have it shipped so as to get the delightful effects. Slate is now being used for this purpose to quite an extent.

The stones should be worked into more or less regular shapes, no sharp angles being allowed and when laid their edges should not be in close contact, the spaces between are filled with cement mortar or, where preferred, dirt in which the grass is allowed to grow. Today the grass which our ancestors railed about for growing between the random stone-laid terraces and paths is highly appreciated.

Where the stones can be had of nearly equal thickness throughout—as is the case where blue stone or slate is used—they may be simply laid flat upon the foundation and grouted with liquid cement. Where the stones vary much in thickness it is better to build them together like rubble work.

Whenever possible secure stones of different colors for the same piece of work as when rightfully handled a very artistic mosaic-like result can be obtained.

—*Building Age.*

BUILDING PROSPECTS CONTINUE GOOD

General satisfaction with building is evident among representative firms in the Eastern construction industry. Replies to questionnaires sent out by the Dow Service Daily Building Reports (says *Architectural Forum*) indicate that the principal retardants to a free construction market are the high cost of labor and materials and the shortage of money for commercial building purposes.

Some of the firms questioned were of the opinion that the only reason production does not exceed demand is because the fuel shortage has prevented full capacity production. Others charge that production is being held back to keep prices high in the face of growing demand.

Still others believe that there will be a reaction in demand for new buildings due to the lessening returns from rent.

Contracts that are already let for the remainder of the year are sufficient to prevent a general price slump before the opening of the 1923 season, according to the bulk of replies received. Most of those answering believed that the price peak had been reached, if no further influence was exerted upon it by the coal strike.

Replies to the question as to whether labor is at present freely available or scarce brought replies from 29 that available labor was either inefficient or practically out of the market; 61 reported plenty of labor. The greatest scarcity is apparently among bricklayers, tile layers, plasterers and some metal workers. Opinion was practically unanimous that labor liquidation would not take place before 1923 building season begins.

—*Industrial Digest.*

"MR. ROLLIN C. CHAPIN, an Eastern architect, writes of the stepback building of which several examples have recently been built in New York, as indicating a "new type of American architecture." "There is really nothing particularly new about this type of construction," comments *The Architect and Engineer*. Mr. F. W. Fitzpatrick of Chicago wrote of step-back buildings for *The Architect and Engineer* as far back as ten years ago. The time for building this type of structure, however, seems not to have arrived until recently, hence the "discovery" of a "new" American Architecture. Writing of his observations in an Eastern publication, Mr. Chapin observes:

"Probably no one who has visited New York City during the past year or two has failed to notice that a new type of skyscraper has come into being. Instead of the cut-and-dried 'scraper to which we have been so long accustomed, with its 20 to 40 stories of facade rising unbroken from the street and crowned by a huge projecting cornice, we observe that these newer buildings begin to step back from the building line at a certain height, something in the manner of superimposed blocks of diminishing sizes. These tower-like upper stories are treated in interesting variety, not one side only, but all four as a unit, and the great ugly cornice is conspicuously lacking. What a relief to at last see business buildings designed in three dimensions!

"This new type of building is the result of New York's new zoning law. This law broadly stated, operates in two ways to bring about a more harmonious development of the city. First, by its "use regulations," it segregates the manufacturing plants from the retail sections and both from the residence districts. Second, by its "height regulations," it divides the city into districts in each of which the allowable height of the street facade has a definite relation to the width of the street, varying from street width to two and one-half times the street the total height of the building, but on width. This limit is not, however, on the vertical height at the building line. Above that limit buildings may be extended to a height limited only by economical considerations, but the portions above the limiting height must not extend beyond a diagonal line drawn through the center of the street and the limiting height at the street line. Other provisions effect the height on the rears, on courts, side streets, etc. In a general way, this means that above the height limit all buildings must be contained within a pyramid whose sides have a slope of about 75 degrees. Therefore, a large building may rise to considerable height above the facade height limit, while a smaller building cannot economically be built much higher than that limit.

"It will be seen that this law has given the architect a new problem. He must use greater skill in planning in order to make it economically desirable to build to great heights, and at the same time he is given almost unlimited scope to his imagination in designing in three dimensions.

"While not a great number of buildings have been erected since this law was passed, the few that have been are so satisfactory, both economically and aesthetically, as to fully justify the law. A notable example is the Heckscher building, near Columbus Circle, designed by Messrs. Warren & Wetmore."

Mr. Chapin thinks that this style of tall building is destined to become the prototype for all American cities. He believes the idea could be applied on a smaller scale to our moderate-sized cities. It is true we need some remedy for the the oft-repeated crime of treating architecturally only the street facades of our buildings, and allowing the other sides, perhaps more conspicuous than the embellished one, to glare at us with their bare common brick surfaces, ugly signs, and what-not. Some such regulation as New York's would help to answer this need, and would do much to beautify our business sections.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

Ideals are like stars; you will not succeed in touching them with your hands, but like the seafaring man on the desert of waters, you choose them as your guides, and, following them, you reach your destiny.—Carl Schurz.

A certain wallboard man advertised in the Guide for awhile and then dropped out. We've had a dozen inquiries since then, asking for his address—every inquiry from a cash buyer. This is a common occurrence. It's hard to make some advertisers see the vital importance of a standing "ad."

As The Editor Sees It

THE HOUSE-BUILDING INDUSTRY AS SEEN BY AN ENGINEER

More Co-operation Needed Among Architects, Engineers, Builders and Realtors—Are we Coming to Shop-Fabricated Chimneys, Whole Bathrooms, and What Not?

BY W. H. HAM, M. AM. SOC. C. E.

General Manager, The Bridgeport Housing Corporation, Bridgeport, Conn.

The fundamental problems in building houses can be simply referred to as: (1) Securing building lots, (2) financing, (3) plans for houses, (4) labor and materials for construction. Everyone of these main items is affected by lack of co-ordination, and each should have most careful study by trained experts in the closest co-operation with real estate men, landscape architects and with bankers, building and loan association officials and manufacturers. There should be the closest co-operation with the best architects in the country for development of proper house plans. Engineering skill should be thoroughly developed in the problem of building houses with all possible simplification and standardization of the labor and materials.

Lot Determines Type of House

Taking the first item, land division into house lots: Most of our cities have established a standard lot with street frontage varying from 16 2/3 ft. to 50 ft.; these lots vary in depth from 100 ft. to 150 ft. When the land is thus divided, the type of house is automatically established and in most cities repitition of type with minor changes in exterior and interior becomes the prevailing form which the house takes.

There are three distinct types of single house which stand out as important in the great building era just ahead of us. In the cities which are thoroughly built up and lots are subdivided into small frontages from 16 2/3 ft. to 25 ft. row houses will and should prevail. This house is built with party walls and has openings only at front and back except those on corner lots.

Immediately the question of whether a city has alleys providing a service to the rear arises. Alleys have their serious objection. The history of the row houses teaches us that several methods of avoiding the alleys have been in use in some of the older cities for a long time and, in my opinion, all alleys should be eliminated.

Proper Homes for Narrow City Lots

The street front of the house should be formal with a service entrance minor in appearance to the main entrance; and the rear of the house should be developed for use of the tenants. It should be developed for use both summer and winter, so as to have complete use of the lot area in the rear. I would sugest a sun parlor built on the rear of the house leading to a garden, however small in area. This layout would apply to all of the houses built on lots 20 ft. or over in street frontage.

Smaller houses built on the lots from 16 2/3 ft. to 20 ft. are handicapped by lack of space for proper room division and, in most cases, have been used for a house with a kitchen-living room at the rear. My feeling is that the minimum depth for proper subdivision of lots is 20 ft., and that some special form of building should be used where division is into smaller lot areas.

The Detached House

The second type of single house which has a very large and important place in the building program is the single six-room cottage type, built on separated lots, usually with from 30 ft. to 50 ft. of street frontage. In our smaller cities where land values have not advanced, this is the most important house for future consideration.

Streets that are thoroughly built up with houses having a frontage of from 30 to 50 ft. have little in front of the which can lend to the individuality of the family except the architectural treatment of the house itself, and it is my opinion that the grounds of such houses should be developed with a view to the neighbors' grounds, so as to harmonize

BLUE PRINTS

the whole street frontage into one continuous planting area.

The introduction of the piazza on the front of the house in most cases is wrong. Here again, the formal entrance with a minor or diminutive porch sufficient only in area to accommodate visitors for a brief period, and the complete development of the rear lot into private garden, and a sun porch where the exposure is correct, or a side porch for reaching the proper exposure, would be very much better than a continuous row of piazzas, so often built with clumsy incorrect architectural lines, disfiguring to the architectural development of a street.

History of houses in America would indicate that the piazza is of recent origin, and that the terrace overlooking the garden in the rear has many examples where values have been retained for over a century. The French home knows no other layout. English gardens are the accepted thing. The American piazza is passing and those who are building for future values should recognize this and either build the "living-out" room or sun porch at the side or rear of the house. When this is done the whole landscape of the area lends itself to more complete and simple treatment.

Rear gardens are private personal enclosures and should be enclosed with hedge, fence or wall, depending upon the exposure and the kind of land. In this garden can be grown the perennial and annual flowers, some small garden vegetables, vines and dwarf trees. In the front of the house on the lawn flowering shrubs, and, where no nuisance from smoke obtains, dwarf evergreens. Street trees complete the planting. We have then a whole city divided as a shrubbery garden in front of the houses and flower gardens and small vegetable gardens in the rear.

Placing the Garage

So far, nothing has been said of the automobile and its garage. In the city of Bridgeport 2000 automobiles stand out without any garage at all, principally for the reason that there is no plan made for location of a garage on the house lot and there is insufficient area for a driveway at the side of the house, the regulation calling for 5-ft. clearance from lot line, unless two adjoining owners combine many houses cannot have a garage at all.

In laying out the house lot of the future the garage is exceedingly important and should be considered thoroughly. The one-car garage can be built very economically and sufficiently complete for the storage of a car. It can be heated with the house if built adjoining the house itself. The architect should dictate the form of building, but many successful simple, flat-roof structures have been built. These simple buildings can carry lattices or vines and become a part of the house without any disfiguring effect, if their placing is carefully planned in advance.

In the more pretentious buildings the tendency toward building the garage as part of the house is more marked and there is no doubt whatever but that the introduction of the same principle in the small house will prevail because of the economy and simplicity of the building and the elimination of an outbuilding inferior in quality to the house which it disfigures.

The two-car garage really does not naturally accompany the small house, but has similar characteristics to the single-car space and can be very well treated in connection with the house itself. The most economical entrance, of course, is directly from the front. Where the land area is large enough the entrance from the rear has been successfully developed and should be considered.

Dividing the Front and Rear of the Lot

I believe there should be a division between the front or public part of the lot and the rear or private part; and many different types of division should be considered. Among the simplest is the lattice which carries vines, the wall which also can carry vines on both sides and the simple fence or hedge. If the lattice is used, an archway in the lattice can be arranged so as to have the entrance to garage inconspicuous and a part of the landscape work.

Out-House Storage Facilities

The great American home of the past generation has many references in it to the woodshed which was an active part of the home life of the country people. This was a storage space for the fuel used and every American boy of the past generation had some controversy with his father in the woodshed. With the use of coal for heating and storage of this material in the cellar, there is very much less demand for a space outside of the house for storage than in the old-time country homes, but this demand is not entirely eliminated and there should be a space set side for the storage of children's toys, accumulated rubbish (which is to be taken away presumably by the city collection department) and the variety of household necessities most conveniently stored in some definite space where they will neither clutter up the back yard nor disfigure the formal front of the home.

One very simple arrangement which has been successful is to develop a clothes yard behind a lattice between the house and the garage. The garage is placed with its front on the same line as the

Waterproofed with
Trus Con Waterproofing Paste

Trus Con Waterproofing Paste (Concentrated)

Is a scientific product, developed by our technical staff. It is used in practically all the large operations throughout the country. Mixed with the tempering water, it contributes powerful water repellent qualities, but does not weaken the concrete nor interfere with the normal development and setting of the cement.

(Continued from page 568)

house, space between the garage and the house being paved and screened from the street with a lattice covered with vines, and from the garden with the same form of lattice work. Entrance to the rear of the house being through the gate in the lattice, this open space, either covered or not, is open area for storage and becomes very useful with the small home on a limited land area.

The Two-Family Type House

The third type of house which has a very important influence on the home life of the people, and is in many cities a very important part of the building program, is the two-family house. Usually, it is arranged with flats having individual entrances for each family. Such a building should not be placed on land less than 50 ft. wide and should be very carefully studied for individuality of entrance and separation of the families, and, of course, should be built with sound-proof floors and double equipment throughout.

The advantage of the two-family house is not so apparent as in previous years because of the increase in the cost of building, lowering the value of the two-family property as an investment, and the great demand for money in other forms of investment. This brings the average citizen into touch with many forms of security in which his money can be invested to very much better advantage.

However, the type still prevails and should have the closest attention according to its requirements. The two-family house with its two garages, its two gardens two clothes yards and two piazzas as now built leaves very little on the lot, if 50x100 ft., which can be used for anything except the smallest kind of a flower garden. My own opinion is that this type of building has so many disadvantages that it should be discouraged.

Single-Family Type Best for Most Conditions

The American home should be the single type of house, either in row type or individual, where land values are low enough to allow each family to have sufficient land for its own land, and where land values have advanced beyond this figure the multiple amily house or many varieties recently developed should be considered.

The Multiple-Family House

It is this multiple-family house that requires the most careful study by the engineering profession, architects and financiers, and we could and probably will work out a suitable form of ownership, which reaches down the scale to our lowest paid industrial workers. My own personal belief is that we will very soon arrive at a solution of this part of the problem by the development of a form of ownership of the land and buildings. I believe this form of ownership will have in it a means of progression from every limited early part ownership through the period of accumulation of savings to the fee simple ownership of one of the other types of homes, without loss in investment; but this is a great problem and not a part of this article. I only refer to it here as applying to that area of land in our cities which has advanced beyond the value which is suited to occupation by the individually-owned house, either of the row type or the individual type.

The Financial Problem

Referring to the financial problem before us in our great building program ahead, I stated in a paper read before the Massachusetts State Chamber of Commerce that our financing of homes was in practically the same situation as our agricultural financing in New England. In our great industrial cities, and in the small ones as well, the banker who handles the money accumulated by the people will say to you, "I am not interested in real estate; it does not pay." The manufacturer will say the same thing, especially if he has had any experience in the housing of his employes. The merchant will say, "I am not interested."

We have then before us a problem in which the three fundamental dictators of industry, the banker who finances everything, or guides its finances by his advice and influence outside of his own field, the manufacturer who creates wealth with which to finance, and the distributor of the manufactured articles, have all three abandoned the building field because it does not pay. It often leaves the financial side of the building homes in the hands of those who are determined to take every advantage of the tight money situation.

The reason for this lack of interest on the part of the banker is very simple. The tremendous number of securities on the market available, in small denominations, for investment of everybody's money, is in direct competition with the building of homes; and the careful analysis of financing back of these securities is so much better than that which has guided the money side of the home-building problem that the house investment, even with the present high rents, is at best a very poor one.

The great problem of financing homes should have the closest attention of bankers, manufacturing executives and commercial retailers. Every one of these influences should be brought into the home finance problem in such a way as to take a fair share of the burden of the investment, bad as it is, and I would go so far as to say that every bank should develop within its organization the means of obtaining thorough classified information on the subject of financing of homes and have this information available for all of its customers.

Every manufacturing concern in an industrial community, in my opinion, should set aside from its earnings each year a certain amount of money, based upon its payroll, for investment in some form of building fund as, for example, the paid-up shares in building and loan associations or for investment through trust companies and banks in mortgages or in an operating housing company. Every successful retail store should set aside a certain percentage of its earnings for investment in homes, in some form or other, for it is the clerical force in the stores which finds the home problem one of the most serious to contend with.

Engineering Studies to Be Basis of Financing

It is very evident that the financial development of the great industries of this country have learned to depend upon scientific, thoroughly studied engineering reports and no great industry has ever gone forward without careful engineering investigation. The housing problem is a great and important industry and should have its engineering side fully developed so as to bring home to banking interests, manufacturers and merchants exact facts which are now lacking, and which are hidden behind a great deal of doubt as to values; and, what is worse than doubt of values, is the present morality of the building trades. The engineering profession from its foundations is based upon integrity. Facts are facts with the engineer and are so recognized in the financial world because of this fundamental schooling back of the engineering

profession, and it is for this reason very largely that financial houses turn to the engineer for an examination of the case before any investment is made.

The engineer is needed in connection with house planning for all kinds of homes, with the introduction of water, gas, electricity, heating and many other mechanical devices which are to be installed in the homes of the future. The engineer has been called upon to lay the street mains, sewer, water and gas and determine in advance the required sizes for development of the city, proper material for a long-time use and regulations governing the rights and privileges of citizens who are land owners in connection with these public services.

The great question has always been: Why should the engineer stop at the point 5 ft. outside of the wall of the building and allow the remainder, which is the most intricate and quite as important a part of the whole intricate system of planning, to be carried out by other men, not especially trained.

"What is the architect's function," is naturally the next question. The architect's training at the schools of architecture in America and those abroad, where many of our best architects are sent for their finishing courses, is to provide a form of beauty with the structure that they build. The best architects recognize this and employ engineers, either in their own offices direct or through consultation with engineering firms, to carry out that portion of their work which is manifestly within the engineering field.

But the small house, which is our great problem, the individual home for the average Amercan, as often been left without either architect, engineer or financier. The great question, of course, is who is to pay for this professional service. The individual small house cannot have this individual care. It must have the study made by groups, and it is this group study of the problem that will command the closest interest of the engineer.

What the Engineering Problem Consists Of

The engineering problem in connection with the building of ordinary houses, for the great class of home buyers who must of necessity purchase on the installment plan, has just begun to be studied; and a few examples of successful results where the engineering work has been done with care warrants the conclusion that the engineer is primarily suited to the construction end of the problem, and that the architect must dictate the style and provide the design. The architect of high standing cannot give his time to the construction items and is not properly trained to carry out this part of the work.

It is only when the engineering profession takes hold of the problem as it has the great problem of transportation, factory construction, sanitation of cities and road building that the lending institutions will look upon housing investments with favor.

When the work is properly co-ordinated, simplified and standardized those of us who have studied deeply into the subject anticipate that many improvements in methods of construction will prevail, a better relation with labor developed, and a more harmonious result obtained.

I venture to prophesy that a very large part of houses of the smaller type will be shop fabricated in the same manner as our structural steel is today fabricated. I look for a very large field of industry to grow up in this very item of fabrication of parts of houses.

Shop Fabrication of House Parts

Among the items which will readily yield to shop fabrication with a good deal of economy are the doors and frames, which I venture to say will be fabricated complete in a factory, probably local, in a manufacturing process so as to be shipped complete ready for use. The same is true of window frames, sash, screens, including trim inside and out, cornices of the buildings in accordance with the architect's requirements and cut, if you please, with a cutter of his own design. Various mouldings, to suit his good taste, will be made and sold complete ready for installation including all members outside of the square building line. Dormer windows and interesting bay windows, having the best detail of architectural study, can be manufactured in the shop complete ready for installation at tremendous saving in cost.

The foundations of buildings should be made in a foundry, cast hollow, shipped to the job complete read for erecting with the manufacturer's truck and setting derrick, to be erected by the manufacturer in an incredibly short time. These hollow castings, of concrete, can be filled with local heavy materials from the building site, for the added weight required. By the shop-fabricated method, the chimney of the average house can be built of reinforced concrete, including the flue lining of tile, and erected in much the same manner as a heavy telephone pole is now, handled by men familiar with this class of work and with a simple, proper, strong rigging attached to a motor truck.

Let us draw on our iaginations a little further and say that the plumber cooperates and allows his portion of the work to be simplified, standardized and fabricated at his shop so that all parts of the piping system are cut to measure by machine and fitted when carried to the job, because a templet is used in the layout and standard equipment planned for. Carrying this rather difficult matter of imagination to its logical conclusion would lead to the construction of the bath room itself from the floor to a low wainscot line in a shop of foundry, and this completed part of the building transported and erected by a simple derrick arrangement, much as a piano is handled, for the weight will be comparable and the size a little larger, thus making of this intricate and troublesome portion of the home construction a product of shop manufacture, available at a tremendously decreased cost.

Fabrication is a word made forceful by the engineering profession. I have on the authority of one of the largest lumber manufacturers in New England an estimate of the possible saving by fabricating such items as doors and trim, windows with their detail and equipment of approximately 50 per cent. in cost. I have no doubt that the whole house will yield at least 33 1/3 per cent. by the fabricated method and, at the same time, furnish the opportunity for the mechanic to work continuously in doors, under shop conditions, and become a fixed citizen in a community instead of a wandering workman dreading the completion of the job for fear of a gap in employment, and the necessary sacrifices which his family will have to make during this interval. Rain and snow will have no retarding influence when we fabricate our buildings indoors, ship them to the job and erect them with properly trained men.

National Builder.

WHY AN ARCHITECT?

An architect does more than build a house. He provides a setting for a personality. He interprets the occupants in terms of their dwelling. He puts four walls and a roof around the atmosphere of a family. Every client is an individual study. The architect sells not only experience and skill; primarily he sells service. He looks after the physical details of building; his roofs do not leak, his paints do not peel, his chimneys do not smoke. He also studies the habits and characteristics of his client, and seeks above all to provide a home in which the owner will be comfortable, happy, satisfied. Beyond the technical side of his profession he will aim to produce those intangible values that make all the difference between a family barracks and a home in which a family will abide content.

To attain this result the architect draws on his expert acquaintance with building

problems in all their multiplicity. Technical skill and artistic gifts combine to make the architect, and it would be strange indeed if a man possessing these qualities could not save his client from many mistakes of judgment and many unwise expenditures. He draws plans, prepares specifications, obtains bids, writes contracts, supervises construction, makes sure the owner gets what he pays for. When the completed building is "delivered" the owner may know that his materials are "right," his house well designed, his workmanship "sound." About one owner in three assumes the architect has no interest in the site, that the dimensions of the lot and the owner's limit of cost are all he cares to know. On the contrary, the architect studies the site. Often he has topograhical survey made with foot contours. He helps the owner place the building on the lot with reference to the views it may command, its distance from the street, the opportunity for lawn and gardens. He advises as to the style of architecture that fits the location and the suitability of the materials to be used, whether brick, stone or timber. He suggests the arrangement of rooms in terms of the site, so that vulnerable points will not be exposed to freezing blasts and living rooms will not be shut away from sunlight and outlook, so that the approach will be effective and the general arrangement convenient. Then the architect is ready for his rough preliminary drawings. After these have been studied he will make the final and complete drawings, the working plans and specifications.

* * *

Four times in five the owner tells the architect what he wants, and how much he will spend, and the architect replies that the two are not compatible. Whenever the owner fixes an absolute ultimate of expenditure the architect has no option but to help his client to scale his building accordingly. Here two facts usually emerge: that a small house is more difficult to design than a large one, if it is not to be merely commonplace, and that an able architect can do remarkable things in the way of elimination and yet keep the essentials. Moreover, experience brings prescience so that the architect will help the owner to avoid those after-thought "extras" and those expensive deviations from the original plans that always run fast into money. He will try to locate every fixture and foresee every detail so that his first plans will direct all operations to the driving of the last nail.

Without an architect the owner is in the hands of his builder or contractor. Doubtless the average contractor means to be honest, but without supervision he is exposed to temptation and it is to his advantage to skimp. Unless the owner is an expert and has time to devote to supervision the builder may use materials below specifications and get 'away with it.' Are there pitchy knots in the lath? They mean yellow spots in the plaster after awhile. Punky framing lumber with many edges is not strong enough. Such terms as "shift" and "slash" mean nothing to the tyro, but if the wrong material is used the floors will splinter up. An owner once noticed that his specifications called "only" for "extra" singles, and added "No. 1." Therefore he roofed his house not with the best shingles, but with the worst. Shingles are graded down from "extra," or knotless; to "clear," with no knots in their exposed portions; and "extra No. 1," with knots anywhere. Clapboarding is "clear" or "extra;" which should be used? Flooring is "clear," "factory," and "No. 2;" which shall you choose? How shall you select your interior finish from the scores that will be urged on your attention? One famous building firm will employ only three crews of plasterers, men who are sure to build "for keeps," whose work will not be "all out" in ten years. Asbestos shingles may be laid in a half-dozen ways producing as many effects and corresponding differences in cost. A certain architect wrought patiently and tactfully to convince his well-meaning but deluded client that a house should have no clapboarding, but block siding; the owner since has expressed his gratitude. An architect will avoid vexing delays. The plumbing and the heating may be in process of installation and the electricians at work before the carpenters finish. Competent supervision means both that the tradesmen shall be punctually on the premises and that the several crews shall not get into each other's way.

As the building business is organized today the contractor and the owner are bound by a standard form of agreement which provides that the contractor shall follow the architect's plans and fulfill the General Conditions of the contract. These General Conditions also are cast in the standard form of the American Institute of Architects. There are some forty-five articles in all, covering all manner of contingencies, defining carefully the rights and duties of all the parties, and treating of documents, drawings, claims, insurance, payments, liens, sub-contracts, corrections, and a hundred other topics. Contractors usually make estimates or submit competitive bids, and here again the owner may well accept the advice of his architect. For estimates vary greatly. Often the highest is really the cheapest. One bidder is accurate and careful; another merely takes a chance with no genuine knowledge back of his proposals; a third may be a shyster who intends to parcel out the job among a score of sub-contractors from each of whom he will exact a profit. Many large contractors today maintain extensive organizations and are well educated and efficient men. But they can hardly be expected to take such an individual interest as does the architect who first conceives the plan, then sketches his vision, and finally watches its development in terms of wood and stone.

The architect almost invariably saves his client the full amount of his fee. He avoids waste of space, time, and materials, and all three mean money. He is not merely a superior sort of watchman, yet he makes sure that what is done is well done. Work well done is permanent, vastly reducing the cost of upkeep.

Choose your architect with care. Then trust him. When he tells you that plain things live and gewgaws do not survive believe him. When your views differ be willing to "be shown." Remember he is trained to apply skilled intelligence to achieve results that fit your needs.—*House Beautiful.*

Repitition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

I make it a rule never to write a grouchy letter—I telephone.

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

The man who doesn't advertise because he can't afford to "do it right" will never reach a position of affluence because everything worth while in the world had to have a beginning, and there can be no "get there" for the fellow who fails to make a start.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

As The Editor Sees It

WHAT IS ZONING?

Zoning is the application of common sense and fairness to the public regulations governing the use of private real estate. It is a painstaking, honest effort to provide each district or neighborhood, as nearly as practicable, with *just such protection* and *just such liberty* as are sensible in that *particular district.* It avoids the error of trying to apply exactly the same building regulations to every part of a city or town regardless of whether it is a suburban residence section, or a factory district, or a business and financial center. It fosters civic spirit by creating confidence in the justice and stability of the protection afforded.

Zoning gives everyone who lives or does business in a community a chance for the reasonable enjoyment of his rights. At the same time it protects him from unreasonable injury by neighbors who would seek private gain at his expense.

Zoning regulations differ in different districts according to the determined uses of the land for residence, business, or manufacturing, and according to the advisable heights and ground areas.

But these differing regulations are *the same for all districts of the same type.* They treat all men alike.

Why Do We Need Zoning?

Someone has asked, "Does your city keep its gas range in the parlor and its piano in the kitchen?" That is what many an American city permits its household to do for it.

We know what to think of a household in which an undisciplined daughter makes fudge in the parlor, in which her sister leaves soiled clothes soaking in the bathtub, while father throws his muddy shoes on the stairs, and little Johnny makes beautiful mud-pies on the front steps.

Yet many American cities do the same sort of thing when they allow stores to crowd in at random among private dwellings, and factories and public garages to come elbowing in among neat retail stores or well-kept apartment houses. Cities do no better when they allow office buildings so tall and bulky and so closely crowded that the lower floors not only become too dark and unsatisfactory for human use but for that very reason fail to earn a fair cash return to the individual investors.

"Live and let live" is a better motto for the modern city than the savage one of "dog eat dog."

It is this stupid, wasteful jumble which zoning will prevent and gradually correct. We must remember, however, that while zoning is a very important part of city planning, it should go hand in hand with planning streets and providing for parks and playgrounds, and other essential features of a well-equipped city. Alone it is no universal panacea for all municipal ills, but as part of a larger program it pays the city and the citizens a quicker return than any other form of civic improvement.

Zoning Protects Property and Health

Suppose you have just bought some land in a neighborhood of homes and built a cozy little house. There are two vacant lots south of you. If your town is zoned, no one can put up a large apartment house on those lots, overshadowing your home. stealing your sunshine and spoiling the investment of twenty years' saving. Nor is anyone at liberty to erect a noisy, malodorous public garage to keep you awake nights or to drive you to sell out for half what you put into your home.

If a town is zoned, property values become more stable, mortgage companies are more ready to lend money, and more houses can be built.

A zoning law, if enacted in time, prevents an apartment house from becoming a giant airless hive, housing human beings like crowded bees. It provides that buildings may not be so high and so close that men and women must work in rooms never freshened by sunshine or lighted from the open sky.

Zoning Reduces the Cost of Living

By zoning millions of waste from the scrapping of buildings in *"blighted districts"* may be eliminated.

A "blighted district" is a district, originally developed for residence or industry, in the future of which people have lost confidence.

The causes of such "blight" are mani-

BLUE PRINTS

fold. The most familiar case is that of a residential district into which there have begun to creep various uses threatening rapid destruction of its value for residences,—such new uses as sporadic stores, or factories, or junk yards. It is not that a few such inappropriate uses really spoil the district, but that people having lost confidence, start a panic, like a "run on the bank." Hundreds of them hurry up to "unload" their properties at a sacrifice for any kind of use, no matter how objectionable to their neighbors—and the "blight" is on! Dwellings worth in the agregate millions of dollars for the purposes for which they were built, and physically fit to serve those purposes for many years to come, with a moderate investment in alterations and improvements, are thus annually abandoned to purposes for which they are not fit, or are left to stand practically idle. Expensive public services of water, gas, electricity, sewers and transportation are maintained at great waste in order to get through the "blighted" district to the more distant and newly fashionable location.

The total economic loss is enormous, and this loss and the risk of it are paid by the people, in the price of house rents or otherwise, as inevitably as they pay the price of the enormous fire losses either directly or through insurance.

Proper zoning cuts these losses at their source, just as proper building regulations and fire protection cut fire losses at their source.

Again, miles of streets and sewers and other utilities, such as are ordinarily built when land is newly subdivided for dwellings, need never be constructed if we know that these areas will be devoted mainly to large factories. Industry will be more efficient, as well as homes more wholesome, if kept generally separate. Separation need not mean great distances for workers to travel. Concentration of uses and a fair apportioning of districts should reduce the amount of all transportation and secure economies not only directly for the worker, but indirectly in the costs of production and marketing of goods.

If zoning can reduce the cost of living, why not have it?

Zoning is Legal

When a zoning law is properly drawn there is no doubt that the courts will support it. Enough favorable decisions have been handed down to show that the courts regard regulation of the uses of land and structures thereon, in accordance with the *kind* of district in which they are situated, as a reasonable exercise of the police power "for the public health, safety, and general welfare."

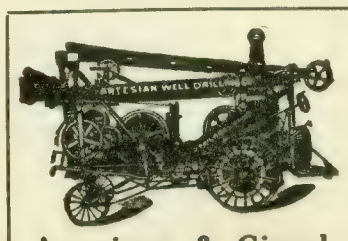
In fact, the courts have approved zoning whenever it was done sensibly and comprehensively. The first case arose in Boston, Masachusetts, where two different heights for future buildings were fixed throughout the city. This was supported by the highest court of Masachusetts and the United States Supreme Court. (Welch v. Swasey, 214 U. S. 91)

The next important case arose in Los Angeles, California, where under a zoning plan dividing the city into industrial and residential districts a brickyard in a residential district was ousted although it had been in existence for many years. This was upheld by the California courts and also by the United States Supreme Court as a proper exercise of the police power. Modern zoning ordinances are not retroactive, however. Hadacheck v. Sebastin, 239 U. S. 394.)

The best zoning case to show how far the courts will go in distinguishing between zoning districts is State of Ohio ex rel. Morris vs. Osborn, et. al., 22 N. P. N. S.) 549. The court held that one and two-family houses were less subject to noise, litter, danger of contagion and fire risk than multi-family houses and that they could be placed in different districts under the police power. This case, however, was not appealed to a higher court and we cannot say whether other states will follow it.

In New York State the highest court has declared the zoning of New York City to be constitutional, stating that zoning can be done under the police power if done with care and good judgment so as not to be arbitrary or confiscatory. Lincoln Trust Company v. William Building Corporation, 229 N. Y. 313).

How To Get Started



Find out if your state has an enabling act permitting localities to zone, even if your city has a charter with home rule powers. If not, the first move must be to secure specific authority from the state legislature. In the following states zoning is already so authorized.

California
Illinois
Indiana
*Iowa
*Kansas
*Louisiana
Massachusetts
Michigan
*Minnesota
*Missouri
*Nebraska
New Jersey
New York
Ohio
Oregon
*Pennsylvania
Rhode Island
*Texas
Virginia
Wisconsin.

*Act does not apply to all classes of cities.

Waterproofed with
Trus Con Waterproofing Paste

Trus Con Waterproofing Paste (Concentrated)

Is a scientific product, developed by our technical staff. It is used in practically all the large operations throughout the country. Mixed with the tempering water, it contributes powerful water repellent qualities, but does not weaken the concrete nor interfere with the normal development and setting of the cement.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., Sept. 5, 1922. Sealed Proposals will be received at this office until 3 P. M., October 3, 1922, and then opened for an extension to the building and driveway, and remodeling interior, at the United States Post Office and Court House, at Parkersburg, W. Va., in accordance with the specifications and drawings mentioned therein. Copies of which may be had at this or at the office of the Custodian, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

Pennsylvania Contracts Awarded

Residence, Elmwood avenue, York, Pa. Architect, H. E. Yessler, Rupp Building, York, Pa. Owner, Harry Weinstock, Newberry and Market streets, York, Pa. Brick, 2½ stories, 40x30 feet, slate roof, hardwood floors, vapor heat, electric light, tile work. Contract awarded to I. Reindollar & Son, York, Pa.

Apartment and Store (alts. and add.), King and Queen streets, York, Pa. Architect, H. E. Yessler, Rupp Building, York, Pa. Owners, Keystone Hotel, care of E. Bush, 132 South Queen street, York, Pa. Brick, 3 stories, 70x31 feet, slag roof, pine floors, hot water heat, electric light, tile work, refrigeration. Contract awarded to S. Gladfelter, York, Pa.

Residence, Lewistown, Pa. Architects, Hamme & Witman, City Bank Building, York, Pa. Owner, Senator F. W. Culbertson, Lewistown, Pa. Brick, 45x33 feet, composition roof, hardwood floors, vacuum heat, electric light, tile work. Contract awarded to Steinbach & Sons, Lewistown, Pa.

School, Walnut street, West of Sixty-ninth street, Stonehurst, Pa., $99,893. Architect, H. W. Castor, Stephen Girard Building, Philadelphia. Owners, Upper Darby Township, Pa. Limestone, brick, cut stone and steel, 2 stories, 147x57 feet, Barrett roof, maple and cement floors, roof ventilators, dampproofing, metal lath, rolled steel sash, copper skylights, iron work and stairs, bond. Contract awarded to Bowden Const. Co., 1935 Chestnut street.

Twin Residence, Narberth, Pa. Architect, private plans. Owner, William Nagle, Narberth, Pa. Hollow tile and stucco, 2½ stories, 47x28 feet, shingle and slag roof, oak and pine floors, hot water heat, electric lighting. Contract awarded to Merion Const. Co., 2313 Walnut street, Philadelphia.

Store and Apartments, Ardmore, Pa. Architect, John T. Norton, Ardmore, Pa. Owner, William Armstrong, Ardmore, Pa. Brick and steel, 2 stories, 20x88 feet, slag roof, oak and pine floors, hot water heat, electric light, tile work. Contract awarded to Merion Const. Co., 2313 Walnut street, Philadelphia.

Stores, Pottsville, Pa. Architect, H. Maurer, 234 North Fifth street, Reading, Pa. Owner, W. S. Weiss, 15 North Centre street, Pottsville, Pa. Brick, 3 stories, 32x90 feet, slag roof, hardwood floors, hollow tile, electric light, tile work, rolled steel sash and skylights, fire doors, roof ventilators, waterproofing, dampproofing, structural iron. Contract awarded to Builder Aregood, Pottsville, Pa.

Foundry Building, Reading, Pa. Architect, F. A. Muhlenberg, 24 North Sixth street, Reading, Pa. Owners, Chantrell Hardware & Tool Co., Millmont, Reading, Pa. Brick, 1 story, 60x90 feet, asphalt roof, electric light, roof ventilators, rolled steel sash. Contract awarded to Beard Const. Co., 658 Penn street, Reading.

Office and Shop, West Chester pike, Highland Park, Pa. Architect, R. R. Neely, 2126 Pine street, Philadelphia. Owner, C. Keiter, care of architect. Stucco, 1 story and basement, 18x23 feet, shingle roof, hardwood and cement floors, plate glass, hot water heating, electric lighting. Contract awarded to J. William Reppenhagen, 23 South Fifty-second street, Philadelphia.

Recreation Pavilion, Lansdowne, Pa. Architect, Paul Monaghan, 1218 Chestnut street, Philadelphia. Owners, St. Vincent's Home, Lansdowne, Pa. Brick, steel and concrete, 2 stories, 59x135 feet, slate roof, cement, pine and maple floors, electric light, metal lath. Contract awarded to Pierce Henon Co., Juniper and Pine streets.

Store and Apartment (alts.), 504 Penn street, Reading, Pa. Architect, Calvin Young, 226 North Sixth street, Reading, Pa. Owner, E. O. Emerick, on premises. Plate glass, copper work, hardwood floors, tile and marble work, roof ventilators, rolled steel skylights, general interior alterations. Contract awarded to Oscar Dagler, 1041 A Walnut street, Reading.

Stores and Apartments (4), Drexel Hill, Pa. Architects, Folsom & Stanton, 10 South Eighteenth street, Philadelphia. Owner, H. J. Rittenhouse, 4219 Lancaster avenue, Philadelphia. Brick, 2 stories, 83x44 feet, slag and slate roof, pine floors, metal lath, hot water heat, electric light, tile work. Contract awarded to Conneen Const. Co., 10 South Eighteenth street, Philadelphia.

New Jersey Construction News

Garden Pier (alts.), Atlantic City, N. J. Architects, Simon & Simon, 249 South Juniper street, Philadelphia. Owners, Pier Realty & Holdings Co., care of Louis Burk, Atlantic City, N. J. Concrete work, carpentry, mill work, slag roof, hardware, plastering, painting, glazing, iron work. Architects taking bids.

School House, Glendora, N. J. Architect, Thomas Stephen, Masonic Temple, Camden, N. J. Owners, Board of Education of Gloucester County, Blackwood, N. J. Brick, 2 stories, 61x75 feet, slate roof, maple floors (plumbing, ventilating, light and heating separate bids). Owners taking bids due September 15th.

Hotel, Bridgeton, N. J. Architects, Dreher, Paul & Churchman, Otis Building, Philadelphia. Owners, Bridgeton Hotel Co., Bridgeton, N. J. Brick, cut stone, granite and steel, 7 stories, 67x110 feet, slag roof, maple floors, hollow tile, metal lath, terra cotta, iron work and stairs, rolled steel skylights, tile and marble work (demolition and elevators reserved). Architects taking bids due September 15th.

Office and Stores (alts. and add.), 38 East State street, Trenton. Architect, W. Hankin, 39 East State street, Trenton, N. J. Owners, Fisher Estate, Edward Fisher, care of architect. Steel, semi-fireproof, 4 stories, 19x65 feet, slag roof, pine floors, hot water heat, electric light, hollow tile, metal lath, tile work, rolled steel sash, roof ventilators, waterproofing, dampproofing. Architect will take bids next week.

Assembling Plant (alts. and add.), Trenton, N. J. Architect, R. G. Consolloy, Commonwealth Building, Trenton, N. J. Owners, Freeman Electric Co., 803 East State street, Trenton. Brick, 1 story additional, 60x60 feet, slag roof, concrete floors, electric light, general interior work, fire doors, ornamental iron work. Architect taking bids due as soon as possible.

Boiler Room, North Broad street, Trenton, N. J. Architect, William Klemann, First National Bank Building, Trenton. Owners, Castania Dairy, North road street, Trenton, N. J. Brick, 1 story, 47x32 feet, slag roof, concrete floors, electric light, rolled steel sash. Owners taking bids.

School, Gloucester Heights, N. J. Architect, Charles R. Peddle, 136 South Fourth street, Philadelphia. Owners, Board of Education, Westmont, N. J. Lowest bidders: Freil McLeister, Inc., 2146 East Norris street, Philadelphia, $27,444, 80 days; Wills Bill Co., 1706 Sansom street, Philadelphia, $27,835, 175 days. Contract for heating and ventilating awarded to Mechanical Equipment Co., Drexel Building, Philadelphia. General contract not yet awarded.

New Jersey Contracts Awarded

Warehouse, Baltic and Delaware avenues, Atlantic City, N. J. Architect, Samuel T. Wagner, Reading Terminal, Philadelphia. Owners, Philadelphia & Reading R. R. Co., Reading Terminal, Philadelphia. Hollow tile, 1 story, 157x100x71 feet, wood roof, concrete foundations, hot water heat, electric lighting, garage, 38¼x60 feet, and office and sleeping quarters. Contract awarded to F. A. Havens Co., 845 North Nineteenth street, Philadelphia.

Residences (6), Hamilton avenue, Trenton, N. J., $30,000. Architect, private plans. Owners, Independent Realty Co., 408 Market street, Trenton, N. J. Brick, 2½ stories, 15x40 feet, slate roof, pine floors, electric light. Conrtact awarded to John Taub, 613 South Warren street, Trenton, N. J.

Garage, 640 East State street, Trenton, N. J., $15,000. Architect, private plans. Owner, R. C. Manning, 221 East Front street, Trenton, N. J. Brick, cement block, 1 story, 46x150 feet, slag roof, concrete floors, electric lighting. Contract awarded to J. Ross & Son, 35 Boudinot street, Trenton.

Store, Hermitage avenue, Trenton, N. J. Architect, private plans. Owner, Charles Hanna, care of builder. Brick, 1 story, 19x38 feet, slag roof, pine floors, steam heat, electric light, plate glass, terra cotta. Contract awarded to Charles Randall, 43 North Hermitage avenue.

(Continued from page 584)

This list does not include Connecticut, District of Columbia, South Carolina and Tennessee, acts of which apply to a particular city; and North Carolina, which has recently passed a City Planning Act granting zoning powers to city plan commissions.

There must be some local official body to initiate the work of zoning. If there is a Planning Board or Commission, that is the logical body to take up the problem. If there is no such body, one should be created, because zoning, to be done with wise foresight, must take account not only of existing conditions and obvious tendencies of growth, but of probable changes and improvements of many sorts. It is part of the general planning problem. It relates to the transportation system, including streets, street railways and other local passenger transportation, railroad freight and passenger service, and water-borne commerce if any. It relates also to public works and utilities, to park, schools, and many special public and private undertakings.

A Zoning Program

Surveys: A zoning ordinance needs to be based on a comprehensive and detailed study of the precise *local conditions*, both present and prospective. What fits one city or town may be a bad misfit for another. There is no short-cut to good zoning in any community through blindly accepting what has been done for another community. The only safe path is a thorough, open-minded examination of the facts in each community as to existing uses, existing densities and heights of buildings, the customs of the people, and the trend of affairs. In every city there are citizens and organizations having in their possession valuable knowledge of local conditions. These have a large contribution to make to those responsible for zoning, although those who have lived their whole lives in a community do not necessarily realize all that is going on about them.

The zoning of a city requires expert professional knowledge just as the presentation of a case in court requires legal training. But just as the lawyer depends upon the layman to secure his facts, so must the professional zoning expert call upon the citizens for much of the accurate information upon which any good zoning regulations must be based.

Technical Advice: The practice of zoning is relatively new in America. We are feeling our way and must learn by experience. Those who have had experience tend to become expert, with broader knowledge of practices that are proving effective. These men are becoming gradually more skilled in the methods of getting at the essential fact of any local situation, and in the interpretation of those facts. If they possess insight and sane judgment, their advance becomes increasingly valuable.

Scope of a Zoning Ordinance: A zoning ordinance consists of one or more maps dividing the city into different kinds of districts; and a statement of methods of regulation to be employed in each district in regard to the use to which property may be put, the height and size of buildings, and the amount of space to be left vacant; with adequate provisions for enforcement.

Getting Public Support: In the process of drafting a tentative ordinance, it is important, by means of full public discussion, to be sure that the ordinance is an "application of common-sense and fairness" and will "provide each district, as nearly as practicable, with *just such protection* and *just such liberty* as are sensible in that particular district." It is essential likewise to be sure that public opinion as a whole will support it.

Zoning in Operation: A zoning ordinance is of value only as it is properly enforced. Because of the difficulty of making with precision the forecasts on which it is based, its operation should be closely followed by those who most intimately understand the reasons for its provisions. Thus, improvements and adjustments may from time to time be intelligently made. It is to furnish in exceptional cases a means for remedying possible injustices that, in some states, provision is made for a Board of Adjustment or Appeals.

It is obvious from the nature of the case that even if a zoning ordinance were drawn with super-human perfection, time and the natural growth of the community may show the need of modifications. The purpose of a zoning ordinance is not to stifle growth, but only to insure that instead of taking place sporadically and wastefully it shall go on in an orderly way, in response to generally recognized needs and with due notice to all concerned.

What Cities and Towns Have Accomplished by Zoning

Undoubtedly the most convincing statement which could be made in regard to the value of zoning is that practically all the large cities of the United States now feel that it is impossible to continue to develop further without the adoption of a building zone plan. New York, St. Louis, Los Angeles, San Francisco, Milwaukee, Washington, Newark, Rochester, Omaha, not to mention smaller cities such as East Orange, N. J., Berkeley, Calif., and Brockton, Mass., already have zoning ordinances in operation, while Chicago, Philadelphia, Detroit, Cleveland, Baltimore, Pittsburgh, ,Portland (Ore.), Atlanta, and many others have zoning plans in progress. Moreover, it is not alone our larger cities which realize the necessity for timely regulation of the uses of property. A considerable number of the smaller towns, especially in California, Ohio, Illinois, New Jersey, and New York, either have passed zoning ordinances or have them in an advanced stage of preparation.

In fact, on April 12, 1922, 58 municipalities in the United States were on record as having zoning ordinances already enacted, and 110 were reported to have zoning plans in progress.

Actual experience with zoning regulations has brought to light certain striking facts.

It is stated on reliable authority that the New York zoning regulations have prevented vast depreciation in many districts and effected savings in values amounting to millions of dollars in established sections. Certain districts have been rehabilitated as a direct result of the zoning ordinance. Another interesting result has been the production of a type of high building believed to be far better than the former elongated matchbox type.

In an analysis of building permits issued in St. Louis in the first fourteen months under the zoning ordinance, it was found that residences tended to follow the residence district and did not even attempt to seek locations in industrial or unrestricted areas. Except commercial buildings which were built partly in commercial and partly in industrial districts, the development of St. Louis

is said to be fitting itself very closely to the zoning plan.

To avoid the common condition that industrial plants encounter of having to do business on a "residential basis," denied large-scale facilities in their vicinity on account of protests by residence owners, Alameda, Calif., among other cities, has established industrial zones in which no new permits to build residences will be granted. A leading municipal engineer is quoted as saying that the prohibition of residences in industrial zones is one of the most important protections to put in a zoning ordinance. This method is being relied on to develop Hoboken, N. J., as a great industrial terminal.

In New Jersey it has been found that the unzoned suburban town is at a distinct disadvantage as compared with the community protected by a zoning ordinance. People are asking themselves why they should invest money in a home or lend money on a mortgage in an unprotected, unzoned locality. The zoned towns are actually absorbing the better grade of development. The result has been that builders, architects, and real estate owners in unzoned towns are persistently urging their local councils to adopt zoning, so that they may have as good a selling proposition to offer prospective clients as their competitors in the zoned towns.

Where To Get Information

Information concerning zoning progress in states and cities of the United States will be made available by the Division of Building and Housing of the Department of Commerce at Washington, D. C. A selected Bibliography of Zoning is issued by the Division, and may be secured on application.

For several years there has been developing a feeling that some agency of the Federal Government should interest itself in building and housing. The Congress of the United States made an appropriation for such activities for the year 1921-1922. The Act appropriating the funds says, among other things, "That as much, of this sum as necessary shall be used to collect and disseminate such scientific, practical, and statistical information as may be procured, showing or tending to show approved methods in building, planning, and construction, standardization, and adaptability of structural units, including building materials, and codes, economy in the manufacture and utilization of building materials and supplies, and such other matters as may tend to encourage, improve, and cheapen construction and housing."

Accordingly, Secretary Hoover created the Division of Building and Housing, which co-operates with all groups interested in housing and construction, such as architects, builders, building material producers and dealers, building trades labor, contractors, builders' exchanges, realtors, building and loan associations, building inspectors, city officials, and others.

The Division has helped local communities in successfully solving their housing problems. It collects and publish monthly prices of twenty-four items of building materials as paid by contractors in different cities. It also makes reports on building activity, such as building permits and contracts awarded, and on general building and housing conditions in the country.

Mr. Hoover has appointed two main committees which co-operate with the Division of Building and Housing. The Advisory Committee on Building Codes, with a Subcommittee on Plumbing, is drafting minimum code requirements for building construction. The Advisory Committee on Zoning is making studies of state enabling acts and zoning ordinances. Its reports should be of distinct aid to communities interested in the promotion of the public welfare and the protection of property values.

THE APPRENTICESHIP PROBLEM

The Shortage of Building Trades Has Aroused the Attention of all and Must Be Dealt With

BY A. W. DICKSON, *Executive Secretary, N. B. T. E.*

One of the biggest questions the building industry has to face at the present time is the universal shortage of skilled mechanics. This shortage is apparent on every hand, the smaller cities being affected as much as the larger center of industry. Even common labor, which a few months ago was abundant, has now become difficult to secure.

The shortage of skilled mechanics is becoming more acute each year, and steps must be taken to correct the situation at once. Some alarming figures recently appeared in the *American Contractor* which show that, out of ten trades surveyed, six actually registered a loss for the ten-year period from 1910 to 1920. Common labor sustained the greatest loss, there being 28.4% fewer men in this work in 1920 as compared with 1910. Bricklayers show a loss of 23.6% over the same period of years, while plasterers and sheet metal workers register losses of 19.8% and 19.2% respectively.

There are a number of contributing factors which have brought about this condition. With the declaration of war in 1917 thousands of boys, who ordinarily would have been drawn into the building industry, joined the colors, and many of the men who did return to civil life found that they were physically unable to enter the building field. Then too, many of them had passed the age when it was possible for them to become apprentices, so naturally they drifted into other lines of work.

Bricklayers Build Automobiles

The high war time wages of four years ago in other industries appealed to many of the men who had already learned their trades and the result is that many of them are lost to the building industry forever. A recent census taken in one of the large automobile factories of Detroit revealed the interesting information that there were several hundred bricklayers working on machines in that particular plant.

Negligence on Both Sides

The unions are responsible to a large extent for the present shortage of mechanics, as they have made it increasingly difficult for boys to become apprentices. Nearly every contractor at some time or another has wanted to put on additional apprentices, but was informed that his quota was filled and therefore he could not take on any more boys. Many contractors, however, have been negligent in their duty also, by not wanting to go to the bother of having apprentices on their jobs.

The results of this shortage are being manifested in various ways. Just now wage scales are being advanced in many places, in spite of the fact that living costs are coming down. The United States Department of Labor in its latest bulletin on living costs show that there has been a decline of 13.5% from May 1921 to March 1922. This decrease should be reflected in wage rates but it is not, due very largely to the shortage of skilled mechanics now existing.

It is an established fact that one of the basic reasons why the coal industry is in such a chaotic condition at the present time is on account of the surplus of miners. It is very generally accepted by both operators and miners alike that there are 200,000 more miners in this country than are needed. How much better would it be for the two industries if many of the miners had become building mechanics.

The clerical field is also overcrowded. In recent years there has been a tendency on the part of too many boys to shun anything that looked like manual labor. The result is that the white collared profession is overcrowded. In this connection it is interesting to note that the employment bureau of the Open Shop Association in San Antonio, Texas, during the year 1921 were able to place over 50 per cent. of the skilled mechanics who

applied for work in permanent positions, while only 14 per cent. of those seeking clerical jobs were placed.

There are a number of advantages to be derived by an ambitious boy from learning a trade in the building industry. There are few fields of endeavor that present greater opportunity. A large percentage of the leading contractors of the country at one time worked at some trade and through persistent effort and hard work succeeded in establishing their own businesses.

A man who has thoroughly mastered one of the building trades does not need to be out of work very long at a time, because wherever he goes in the civilized world there will be a demand for his services. A bricklayer who learns his trade in New York can work at it in London or Tokio. Many of the best mechanics in this country at the present time learned their trades in Europe.

What is the solution of the problem? Congress took a long step forward when in 1917 the Smith-Hughes law was passed, which summarized reads as follows: "An Act to provide for the promotion of vocational education, to provide for cooperation with the states in the promotion of such education in agriculture and the trades and industries; to provide for co-operation with the states in the preparation of teachers of vocational subjects; and to appropriate money and regulate its expenditure."

For the fiscal year ending June 30, 1923, there will be available the sum of $1,750,000 for the purpose of vocational education, distributed proportionately between the various states. In many cities the contractors have taken advantage of the opportunity of establishing trade schools for mechanics and the results are highly gratifying. In Cleveland a class is about to be established and 100 boys have signed up for the course. In Los Angeles a class is being conducted for plasterers. San Francisco has had a number of classes under way for some time. Youngstown, Ohio, established classes in bricklaying, plumbing, electrical work and sheet metal work last year and the results obtained were very satisfactory.

Contractors in many places have failed to avail themselves of the opportunity to establish such classes, and as a result the industry is suffering at the present time.

The Federal Board for Vocational Education at Washington, D. C., is the official representative of the government in this matter and any group of contractors interested can secure additional data by communicating with that body.

—*American Contractor.*

NEED OF A VITAL CODE OF ETHICS

BY F. F. FEIKER,

Vice President of the McGraw Hill Company, New York City

Address delivered at Washington, D. C., June 20, 1922, at the organization meeting of the American Construction Council.

The Broad Basis for the Establishment of a Code of Ethics

In accepting at short notice an invitation to speak before this body, I am presenting, not the views of one who has been active in the construction industry, but rather the point of view of an interpreter and observer over the last 15 years of a trend in our industrial life which seems highly significant.

There are distinct indications today of forces at work in business life which can recreate the purposes of commerce and set high standards for the conduct of business, not only for America but for the world. In hundreds of meetings, across scores of luncheon tables, men are discussing the necessity for a new industrial leadership and the opportunity for that industrial leadership in America. The fine thing about these dscussions by thoughtful men is that each seess in his own profession that opportunity for leadership. The lawyer, the engineer, the economist, the statesman, the industrialist, the banker, the manufacturer, the merchant and the salesman, men in all fields of professional and commercial activity, are thinking in new terms of their work, and each in a different way is giving expression to a universal desire. Each is really trying to answer the question, old as civilization, which was phrased by Dean Kimball of Cornell when he said that we are attempting to solve the problem, "What is mine and what is thine?"

America above all other nations offers the most fruitful opportunity for a new leadership. Our social structure is not laid-up in a stratification of classes. It is still possible for a newspaper publisher to become President of the United States and for a steel hand to head the works. We are, as Americans, idealists. Business to us is an end in itself and not merely a means to an end. The novelist, in interpreting the social responsibilities of industry, usually to its disparagement, is prone to overlook this fact. There is something truly American in the possibility that a man, only 20 years old, may come to our shores from Egypt and in 10 years become owner of a factory and two retail stores.

The ferment for a new leadership of industry may be considered wholly from the viewpoint of the professionalizing of commerce. We are, as a nation, strong individualists. As Secretary of Commerce Hoover has put it, we have a very high individual efficiency in industry, but a very low collective efficiency. Creative business men are seeking for new measures of value. Service as a basis for profit-making is coming to be recognized as the true motive for creative industry. Business men are establishing codes of practice in all lines of industrial activity. Men in business are as human as artists or lawyers or chemists, and the ethical standards of men of business are no higher and no lower than the ethical standards of our people as a whole. What is apparent in industry, however, is a conscious effort, a definite attempt, to make its standards known, to put commerce on a high plane, and to base creative industry on high ethical principles.

The General Character of Codes of Ethics and Sound Business Practice

Perhaps the most complete single contribution recording the professional trend of industry, which in a word is the blending of the service motive and the profit motive, is found in the Annals of the American Academy of Political and Social Science for May, 1922. Clyde L. King, the editor of this most complete summing up of the status of codes of ethics in the professions and in business, points out in his foreword that codes of ethics are important agencies of cosial control. "Until recently," says Dr. King, "business was looked upon solely as a means to a selfish end. The ethics of business were these of the barter market. The buyer could beware. The sole test of the seller was what he could get away with. But modern transportation systems have changed all this. Oranges grown in California must now be marketed in Philadelphia and automobiles are made in Detroit to be sold in the Orient. The manufacturer sells to distant unknown customers through advertising. Even contracts to buy and sell are let by word of mouth. Selling prices must now be announced before goods are produced. Business hangs more and more on good faith. The old adage—"A man's word is as good as his bond," acquires new meaning as a business asset."

Within a few days we have also the testimony of a man recognized as a maker of industrial opinion in the country, Judge Gary of the United States Steel Corporation. In a commencement address at Northwestern University, Judge Gary said, "It may be asserted with absolute confidence that within the last 20 years or more there has been a decided change in the standards and conduct of business. To my personal knowledge, many of the most intelligent managers of business affairs, some very large and

others smaller, who have laid down the cares and difficulties of this life, before their final departure completely changed their opinion and reversed their methods concerning ethical questions.

"This applies also to many who are still living. Hundreds upon hundreds, yes, thousands upon thousands of business men all over this country 20 years ago believd that the subject of ethics had little, if any rightful place in business conduct, now assert and insist that it is essential and controlling. A man of high intelligence and probity about 10 years since, while testifying in court, alluding to a large business concern, said: 'He introduced new rules into the business game.' I think it properly may be claimed that multitudes of leading business men during the last two decades have voluntarily devoted more and more time and energy in a conscientious desire to conduct their business in accordance with the rules of propriety and honesty."

"There is another convincing reason for the noticeable changes resulting from the adoption of ethics in busines," said Mr. Gary. "While the motives are not equally worthy with others, they are very practical and influential with many who would not otherwise be converted. Ethical management brings additional profits to business. Sooner or later it pays in dollars and cents.

If by honesty and fair treatment we satisfy our patrons they will show it in all their dealings. They will be less disposed to be hypercritical. They will be reasonable in all their transactions with us and insist upon only what is practical and proper under all existing conditions and circumstances; and if the producer, or one who renders service, professional or otherwise, is asailed by outsiders, they will champion his rights. This is of much value in times of stress or of unjust criticism.

An Analysis of the Code of Ethics in the Annals

Thus we have stated, both from the broad point of view of society as a whole and of the practical advantages to those activities of society by which it works and earns—business, the value of ethical codes as a base.

A consideration of the practical accomplishments of such codes of ethics as have been established can be found in the Proceedings of the American Academy already referred to. The survey, as presented, is divided into 10 sections:

I. The significance of the Ethical Codes for the Professions.

II. The Ethical Codes of Lawyers.

III. The Ethics of the Medical Profession.

IV. The Ethical Codes of the Engineers.

V. The Ethics of Architects.

VI. Ethical Standards for Teacher, Librarian, Minister and Social Worker.

VII. Ethical Standards for Journalists.

VIII. The Ethical Code of Accountants.

IX. Ethics in business.

and an appendix with the detailed statement of 2.2, codes of ethics already adopted by the various groups suggested.

A review of the detail codes of ethics which have been developed in industry and the professions suggest is two broad generalizations as a basis for the development of a code of ethics on the fact of this organization.

The first generalization is this,, develop your ethical code in such a way that the principles it communicates will be "seven day standards of operation and not seventh day standards." Second: provide some machinery for their enforcement and review, make them principles of action not passive Platitudes.

I have had two or three personal experiences in the development of codes of ethics that have brought the truth of both these generalizations home to me. I would suggest the preparation of a code of ethics into two divisions, in the first put the fundamental statements of what constitutes right or wrong in the relations between members of the organization, and in the second develop ethics in parallel with economics. To state that "Honesty is the best policy" is a fundamental, but more essential is it to make this statement of passive honesty a fighting weapon of truth by shaping it in terms of business practice: such for example as who shall receive commissions and on what basis for the sale of goods and services.

Judge Gary, in the same address from which I have already quoted pays tribute to Theodore Roosevelt for raising business standards by an aggressive policy of action.

It is not fair to the principles of ethics or of economics to assume that a passive policy of honesty will produce business. What we need is a policy of aggressive honesty in creative business. Business is a flowing river, not a placid lake or stagnant pond.

Take a business of manufacturing and distributing goods. A code of ethics may be established in which the manufacturer agrees that it is wrong to do engineering, the jobber that it is wrong to retail goods. This static ethical agreement might stagnate completely the development of an industry in its servce to the public.

If a code of ethics can be devised in which the facts of the numerator are the elements in the industry and the common denominator is the public, the product of this fraction will be an aggressive principle of ethics.

Nor does mere statement of an ideal code of ethics suffice. Machinery is needed to put the code into action to promulgate and develop the truth. I should think it most practical that some system of local non-partisan boards of review be established as the working basis for such an aggressive code of ethics in the great industry which this Council represents. Out of such local boards will come the development of principles of accepted business practice grounded on the sound basis of ethics and economics.

Forcs to Be Put At Work

To make an aggressive policy, the great industrial educational forces of the country need to be put into active co-ordination. There are, in my opinion, four such great educational forces, so constituted and organized that they can be made available:

1. The Industrial press,
2. The engineering and professional schools,
3. The specialized trade and technical associations,
4. The Government and especially the Dept. of Commerce.

The Integrity of American Business

Business needs no apologies. At heart American business is sound in the same degree and for the same reasons that the nation itself is sound. Individually, American business men set high standards for themselves in a very practical way. Specifically, if you ask any so-called successful business man what he looks for first in hiring his associates, he will either answer directly in terms of character or picture his specifications in such a way that character is very evidently the thing he is trying to get at. That the essential quality of individual integrity and character is the basis for creative business enterprise is shown by the fact that, one a man stumbles in full view of the public, the whole structure of business he may have reared tumbles to the ground, because he no longer will be trusted. There are legendary tales of so-called big business men whose "private morals and personal ethics were their own business," but we have had many illustrations of the fact that masterfulness in business can be attained and held only by the sweetness and soundness of personal morality.

It is the collective expression of high ethical standards for the individual which is the foundation for the professional standards of men acting in groups. The structure of business itself rests on credit, which is nothing in the world but a collective appreciation of character.

American industry of the future, with a new vision of service expressed in the practical terms of the professionalizing of industry, is the hope of a reconstructed social and industrial fabric.

As The Editor Sees It

ZONING has been discussed and considered from many points of view by cities throughout the country and has had many advocates and many opponents. Although zoning is in the embronic state the Department of Commerce, Washington, has made a survey of the situation and has issued "a standard zoning enabling act, under which municipalities can adopt zoning regulations."

Section 1. *Grant of Power.* For the purpose of promoting health, safety, morals, or the general welfare of the community, the legislative body of cities and incorporated villages is hereby empowered to regulate and restrict the height, number of stories and size of buildings and other structures, the percentage of lot that may be occupied, the size of yards, courts and other open spaces, the density of population, and the location and use of buildings, structures and land for trade, industry, residence or other purposes. Such regulations may provide that a board of adjustment may determine and vary their application in harmony with their general purpose and intent, and in accordance with general or specific rules therein contained.

Section 2. Districts. For any or all of said purposes it may divide the municipality into districts of such number, shape and area as may be deemed best suited to carry out the purposes of this Act; and within such districts it may regulate and restrict the erection, construction, reconstruction, alteration, repair or use of buildings, structures or land. All such regulations shall be uniform for each class or kind of buildings throughout each district but the regulations in one district may differ from those other districts.

Section 3. Purposes in View. Such regulations shall be made in accordance with a comprehensive plan and designed to lessen congestion in the streets; to secure safety from fire, panic and other dangers; to promote health and the general welfare; to provide adequate light and air, to prevent the over-crowding of land; to avoid undue concentration of population; to facilitate the adequate provision of transportation, water, sewerage, schools, parks and other public requirements. Such regulations shall be made with reasonable consideration, among other things, as to the character of the district and its peculiar suitability for particular uses, and with a view to conserving the value of buildings and encouraging the most appropriate use of land throughout such municipality.

Section 4. *Methods of Procedure.* The legislative body of such municipality shall provide for the manner in which such regulations and restrictions and the boundaries of such districts shall be determined, established and enforced, and from time to time amended, supplemented or changed. However, no such regulation, restriction or boundary shall become effective until after a public hearing in relation thereto, at which parties in interest and citizens shall have an opportunity to be heard. At least fifteen days' notice of the time and place of such hearing shall be published in an official paper or a paper of general circulation in such municipality.

Section 5. *Changes.* Such regulations, restrictions and boundaries may from time to time be amended, supplemented, changed, modified or repealed. In case, however, of a protest against such change signed by the owners of twenty per cent. or more either of the area of the lots included in such proposed change, or of those immediately adjacent in the rear thereof extending ——— feet therefrom, or of those directly opposite thereto, extending ——— feet from the street frontage of such opposite lots, such amendment shall not become effective except by the favorable vote of three-fourths of all the members of the legislative body of such municipality. The provisions of the previous section relative to public hearings and official notice shall apply equally to all changes or amendments.

Section 6. *Zoning Commission.* In order to avail itself of the powers conferred by this Act, such legislative body shall appoint a commission to be known as the Zoning Commission to recommend the boundaries of the various original

DRAWING MATERIALS

BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 3519

BLUE PRINTS

districts and appropriate regulations to be enforced therein. Such commission shall make a preliminary report and hold public hearings thereon before submitting its final report; and such legislative body shall not hold its public hearings or take action until it has received the final report of such commission. Where a city plan commission already exists, it may be appointed as the Zoning Commission.

Section 7. Board of Adjustment. Such legislative body may provide for the appointment of a board of adjustment consisting of five members, each to be appointed for three years. Such board of adjustment shall hear and decide appeals from and review any order, requirement, decision or determination made by an administrative official charged with the enforcement of any ordinance adopted pursuant to this Act. It shall also hear and decide all matters referred to it or upon which it is required to pass under any such ordinance. The concurring vote of four members of the board shall be necessary to reverse any order, requirement, decision or determination of any such administraitve official, or to decide in favor of the applicant any matter upon which it is required to pass under any such ordinance or to effect any variation in such ordinance. Every decision of such board shall, however, be subject to review by certiorari. Such appeal may be taken by any person aggrieved or by an officer, department, board or bureau of the municipality.

Such appeal shall be taken within such time as shall be prescribed by the board of adjustment by general rule, by filing with the officer from whom the appeal is taken and with the board of adjustment a notice of appeal, specifying the grounds thereof. The officer from whom the appeal is taken shall forthwith transmit to the board all the papers constituting the record upon which the action appealed from was taken.

An appeal stays all proceedings in furtherance of the action appealed from, unless the officer from whom the appeal is taken certifies to the board of adjustment after the notice of appeal shall have been filed with him that by reason of facts stated in the certificate a stay would, in his opinion, cause imminent peril to life or property, in which case proceedings shall not be stayed otherwise than by a restraining order which may be granted by the board of adjustment or by a court of record on application, on notice to the officer from whom the appeal is taken and on due cause shown.

The board of adjustment shall fix a reasonable time for the hearing of the apeal and give due notice thereof to the parties, and decide the same within a reasonable time. Upon the hearing, any party may appear in person or by agent or by attorney. The board of adjustment may reverse or affirm, wholly or partly, or may modify the order, requirement, decision or determination appealed from and shal make such order, requirement, decision or determination as in its opinion ought to be made in the premises, and to that end shall have all the powers of the officer from whom the appeal is taken. Where there are practical difficulties or unnecessary hardship in the way of carrying out the strict letter of such ordinance, the board of adjustment shall have the power in passing upon appeals, to vary or modify any of the regulations or provisions of such ordinance relating to the use, contruction or alteration of buildings or structures or the use of land, so that the spirit of the ordinance shall be observed, public safety and welfare secured and substantial justice done.

Section 8. Remedies. In case any building or structure is erected, constructed, reconstructed, altered, repaired, converted, or maintained; or any building, structure or land is used in violation of this Act or of any ordinance or other regulation made under authority conferred thereby, the proper local authorities of the municipality, in addition to other remedies, may institute any appropriate action or proceedings to prevent such unlawful erection, construction, reconstruction, alteration, repair, conversion, maintenance or use, to restrain, correct or abate such violation, to prevent the occupancy of said building, structure or land or to prevent any illegal act, conduct, business or use in or about such premises.

Section 9. Conflict With Other Laws. Wherever the regulations made under authority of this Act require a greater width or size of yards or courts, or require a lower height of building or less number of stories, or require a greater percentage of lot to be left unoccupied, or impose other higher standards than are required in any other statute or local ordinance or regulation, the provisions of the regulations made under authority of this Act shall govern. Wherever the provisions of any other statute or local ordinance or regulation require a greater width or size of yards or courts, or require a lower height of building or a less number of stories, or require a greater percentage of lot to be left unoccupied, or impose other higher standards than are required by the regulatons made under authority of this Act, the provisions of such statute, or local ordinance or regulation shall govern.

Waterproofed with
Trus Con Waterproofing Paste

Trus Con Waterproofing Paste (Concentrated)

Is a scientific product, developed by our technical staff. It is used in practically all the large operations throughout the country. Mixed with the tempering water, it contributes powerful water repellent qualities, but does not weaken the concrete nor interfere with the normal development and setting of the cement.

Garage, Pittston, Pa. Architect, Vincent Russoniello, Scranton Life Building, Scranton. Owners, Gillespie & Moran, Pittstown, Pa. Steel, fireproof, 1 story and basement, 150x120 feet, built-up roof, concrete floors, steam heat, electric light, hollow tile, rolled steel skylights, roof ventilators. Owner sub-letting.

Residence and Store, Scranton, Pa. Architect, V. Russoniello, Scranton Life Building, Scranton, Pa. Owner, Joseph Long, 1103 Amherst street, Scranton, Pa. Frame and stucco, 2 stories and basement, 36x40 feet, slag roof, hardwood floors, steam heat, electric light. Owner taking sub-bids.

Garage, Scranton, Pa. Architect, G. T. Price, Miller Building, Scranton, Pa. Owner, name withheld. Hollow tile and brick, 1 story, 90x80 feet, slag roof, concrete floors, steam heat, electric light, hollow tile, hollow metal sash, fire doors, waterproofing. Plans in progress.

Garage, Nanticoke, Pa. Architect, G. T. Price, Miller Building, Scranton, Pa. Owner, name withheld. Hollow tile, brick, 2 stories, 40x100 feet, slag roof, concrete floors, hollow tile, steam heat, electric light, freight elevators, hollow metal sash, fire doors, waterproofing. Plans in progress.

Store, Washington street, Scranton, Pa. Architect, Louis Reisman, Miller Building, Scranton, Pa. Owners, New Wall Paper Co., 116 North Washington street, Scranton. Fireproof, steel, brick, 4 stories, 80x158 feet, slag roof, hardwood floors, electric light, tile and marble work, metal lath, copper front, roof ventilators, skylights, ornamental iron work. Plans in progress.

Sales Warehouse, Pittsburgh, Pa. Architects, Howley & Coon, Traders' Bank Building, Scranton, Pa. Owners, Fairmount Cream Co., Omaha, Neb. Steel, reinforced concrete, 5 stories and basement, 72x100 feet, concrete floors, steam heat, electric light, tile work, freight elevators, rolled steel sash, fire doors, skylights, waterproofing and dampproofing, floor hardener, ornamental iron work. Plans in progress.

School, Clarks Summit, Pa. Architect, H. C. Rutherford, 316 Washington street, Scranton, Pa. Owners, Clarks Summit School District, W. Widdowfield, secretary, Clarks Summit, Pa. Brick, stone, 2 stories and basement, 155x152 feet, slag roof, hardwood floors, metal lath, tile work (heating, plumbing and electric work reserved), rolled steel skylights. Owners taking bids due September 25th.

Eagles Home, Wilkes-Barre, Pa., $100,000. Architects, Schroeder & Schmidt, Weitzenkorn Building, Wilkes-Barre. Owners, Order of Eagles, care of architects. Semi-fireproof, 3 stories, 100x100 feet, built-up roof, hardwood floors, steam heat, electric light, hollow tile, metal lath, dumb waiters, tile, marble and terrazzo work, rolled steel sash and skylights, fire doors, roof ventilators, waterproofing, iron stairs, ornamental iron work. Owner will take bids in two weeks.

Residence, Kingston, Pa. Architects, Sturdevant & Foster, Coal Exchange Building, Wilkes-Barre. Owner, Dr. A. W. Grove, Kingston, Pa. Tile and stucco, 2½ stories, 34x38 feet, slate roof, hardwood floors, electric light, tile work. Architect taking bids.

High School and Gymnasium, Parson, Pa. Architect, R. Herr, Simon Long Building, Wilkes-Barre, Pa. Owners, Parson School Board, Robert Wallace, secretary, Parson, Pa. Brick, 2 stories and basement, 99x110 feet, slate roof, hardwood floors (heating, plumbing and electric work reserved), hollow tile. Owner ready for bids due September 27th.

Residence, Kingston, Pa. Architects, Schroeder & Schmidt, Weitzenkorn Building, Wilkes-Barre. Owner, H. C. Rippard, care of architects. Frame and stucco, 2½ stories, 25x32 feet, slate roof, hardwood floors, steam heat, electric light, tile work. Architects ready for bids.

Warehouse, Wilkes-Barre. Architect, T. H. Atherton, Coal Exchange Building, Wilkes-Barre. Owners, Lawrence Meyers Estate, care of architect. Steel, brick, 4 stories, 60x120 feet, slag roof, pine floors, electric light, freight elevators, fire doors, waterproofing and dampproofing, iron stairs. Owner taking sub-bids.

Vocational School, Mill City, Pa. Architect, J. H. Davey, Coal Exchange Building, Scranton, Pa. Owners, Mill City School Board, W. J. Agrey, Mill City, Pa. Frame, 2 stories, 70x86 feet, shingle roof, pine floors, steam heat, electric light, roof ventilators. Plans in progress.

Pennsylvania Contracts Awarded

Chapel, near Lansdale, Pa. Architect, Paul Monaghan, 1218 Chestnut street, Philadelphia. Owners, St. Mary's Institute for the Blind, care of Cardinal D. J. Dougherty, Eighteenth and Race streets, Philadelphia. Brick, cut stone, steel and plaster, 1½ stories, 38x92 feet, slate roof, pine floors, electric lighting, metal lath, tile and marble work, terrazzo, bond, iron work (heating and plumbing reserved). Contract awarded to Specht & Sperry, Heed Building, Philadelphia.

Residence and Garage, Mason avenue, Drexel Hill, Pa. Architects, MacKenzie & Wiley, Liberty Building, Philadelphia. Owner, F. L. Meagher, 122 South Fifty-first street, Philadelphia. Stone and stucco, 2½ stories, 39x29 feet, and 1½ stories, 20x22 feet, shingle roof, oak and pine floors, iron work, bond, electric lighting, warm air heating. Contract awarded to A. R. Alessi, Darby, Pa.

Residence, Edmund avenue, Drexel Hill, Pa. Architects, MacKenzie & Wiley, Liberty Building, Philadelphia. Owner, C. B. Wood, care of architect. Frame and stucco, 2½ stories, 23x39 feet, shingle roof, oak and pine floors, hot water heat, electric light, bond, iron work. Contract awarded to Carmine Mattia, 433 North Sixty-fifth street, Philadelphia.

Orphanage (add.), Abbottstown, Pa. Architect, Paul A. Monaghan, 1218 Chestnut street, Philadelphia. Owners, Paradise Protectorate, Rt. Rev. P. J. McDevitt, Harrisburg, Pa. Brick and stone, 2 stories and basement, 55x110 feet, slate roof, pine floors, steam heating, electric lighting, tile and marble work. Contract awarded to John Stapf, 2246 North Third street, Harrisburg, Pa., but not yet signed.

School, Sunbury, Pa. Architect, Ralph M. Herr, Simon Long Building, Wilkes-Barre, Pa. Owners, Sunbury School Board, Robert Worrell, secretary, Sunbury. Brick, 2 stories, 80x106 feet, composition roof, hardwood floors, hollow tile, electric light, roof ventilators. Contract awarded to Shamokin Lumber & Const. Co., Shamokin, Pa.

Store and Office, 913 Hamilton street, Allentown, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown. Owner, T. T. Keiter, 909 Hamilton street, Allentown, Pa. Brick, steel, tile, 3 stories, 22x110 feet, built-up roof, yellow pine floors, steam heat, electric light, metal lath, tile work, rolled steel sash, hollow tile, terra cotta. Contract awarded to Schaeffer & Laudenslager, Allentown, Pa.

Residence, Allentown, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owner, William N. S. Carl, care of architects. Brick and stone, 2 stories, 37x16 feet 9 inches, 33x16 feet 5 inches, composition roof, hardwood floors, electric light, tile work, porches. Contract awarded to A. E. Nichols, Commonwealth Building, Allentown.

Store and Apartment, 637 Broadway, Bethlehem, Pa. Architect, C. F. Spangenberg, 504 Broadway, Bethlehem, Pa. Owner, Mr. Roponbo, care of architect. Brick, 3 stories, 20x45 feet, slag roof, hardwood floors, hot water heat, electric light, tile and marble work. Contract awarded to Philip Rowea, Bethlehem, Pa.

Residence, Wynnewood, Pa. Architect, Horace Trumbauer, Land Title Building, Philadelphia. Owner, Mrs. H. Parr Dole, care of architect. Stone, 2½ stories, 48x61 feet, shingle roof, hardwood floors, hot water heat, electric lighting, tile and marble work. Contract awarded to Milton W. Young, Overbrook, Philadelphia.

Residence (alts. and add.) to Apartment, Lancaster, Pa. Architect, H. Y. Schaub, Imperial Building, Lancaster, Pa. Owner, Dr. Twitmire, 130 East Chestnut street, Lancaster, Pa. Brick, 1 story, 30x42 feet, slag roof, hardwood floors, hot water heat, electric light. Contract awarded to Luther Wohlsen, 42 Parkside avenue, Lancaster.

Residence, Lucknow, Pa. Architect, F. G. Fahnestock, Patriot Building, Harrisburg, Pa. Owner, Miss Caroline Keefer, Riverside Drive, Harrisburg, Pa. Brick, stucco, 2½ stories, 32x44 feet, shingle roof, hardwood floors, vacuum heat, electric lighting. Contract awarded to W. E. Bushey, Lemoyne, Pa.

Bungalow, Royersford, Pa. Architect, J. Vincent Poley, 162 Second avenue, Royersford, Pa. Owner, Jacob W. Wagoner, 401 Fifth avenue, Royersford, Pa. Brick and stone, 1½ stories, 27x34 feet, asbestos roof, yellow pine floors, steam heat (heating, plumbing and lighting reserved). Contract

awarded to A. L. Brockerman, Limerick Square, Pa.

Store and Office, Adams street, Scranton, Pa. Architects, E. H. Davis and George M. D. Lewis, Union Bank Building, Scranton, Pa. Owner, Walter Rehrig, care of architects. Brick, stone, reinforced concrete, 5 stories, 100x41 feet, slag roof, concrete and hardwood floors, electric light, metal lath, tile and terrazzo work, elevators, roof ventilators, copper work. Contract awarded to Beilman & Son, 220 Ash street, Scranton.

Residence, Clarks Summit, Pa. Architect, Fred Nelson, Connell Building, Scranton, Pa. Owner, Gordon Taylor, care of architect. Frame, stucco, 2 stories, 32x40 feet, shingle roof, hardwood floors, steam heat, electric light, tile work. Contract awarded Eugene Tannler, 307 Neptune Place, Scranton.

Residence, Scranton, Pa. Architect, V. Russoniello, Scranton Life Building, Scranton, Pa. Owner, T. Dainto, Scranton, Pa. Frame, 2 stories, 32x38 feet, shingle roof, hardwood floors, vapor heat, electric light. Contract awarded to Thomas Bisignani, Scranton, Pa.

Double Residence, Nanticoke, Pa. Architect, G. T. Price, 409 Miller Building, Scranton, Pa. Owners, Jacob & Jenninger, Nanticoke, Pa. Frame, 2½ stories, 32x42 feet, composition and shingle roof, pine floors, hot water heat, electric light, tile work. Contract awarded to Quoss Brothers, Nanticoke, Pa.

School (alts. and add.), Aristes, Pa. Architect, J. J. Howley, Traders' Bank Building, Scranton, Pa. Owners, Conyngham Township, Edward J. Britt, on premises. Brick, 2 stories and basement, 80x64 feet, hardwood floors, electric light, tile work, general alterations. Contract awarded to E. R. Bastren Co., Mt. Carmel, Pa.

Seminary, Scranton, Pa. Architect, J. J. Howley, Traders' Bank Building, Scranton, Pa. Owners, St. Mary's Seminary, care of Bishop Hoban, Scranton, Pa. Limestone, stone and brick, 3 stories, hardwood floors, metal lath, electric light, tile, marble and terrazzo work. Contract awarded to Boland Brothers, 427 Spruce street, Scranton.

Warehouse (add.), Wilkes-Barre, Pa. Architects, Schroeder & Schmidt, Weitzenkorn Building, Wilkes-Barre. Owners, Robbins Lumber Co., care of architects. Brick, steel, 3 stories, 45x62 feet, built-up roof, maple floors, electric light, fire doors. Contract awarded to J. A. Schmitt & Sons, Simpson street, Wilkes-Barre.

Loading Shed, Wilkes-Barre, Pa. Architects, Schroeder & Schmidt, Weitzenkorn Building, Wilkes-Barre, Pa. Owners, Robbins Lumber Co., care of architects. Fireproof, 1 story, 18x42 feet, copper work, iron work. Contract awarded to Wilkes-Barre Iron Works, Coal Exchange Building, Wilkes-Barre, Pa.

School, Minersville, Pa. Architect, Austin Reilly, Bennett Building, Wilkes-Barre, Pa. Owners, Minersville School Board, J. Blazejewski, Minersville, Pa. Frame, 2 stories, irregular size, steam heat, electric light, slag roof, hardwood floors. Contract awarded to Nanticoke Const. Co., Nanticoke, Pa.

High School, Freeland, Pa. Architect, R. M. Herr, Simon Long Building, Wilkes-Barre, Pa. Owners, Freeland School Board, Freeland, Pa. Brick, 2 stories and basement, 150x100 feet, slag roof, hardwood floors, electric light, metal lath, tile work, hollow tile, roof ventilators, rolled steel skylights. Contract awarded to James Boyle, Freeland, Pa.

New Jersey Construction News

Residence, Somers Point, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City, N. J. Owner, Mrs. Robert Craighead, care of architect. Architect taking bids due September 26th.

Store (alts. and add.), 1914 Atlantic avenue, Atlantic City, N. J. Architect, A. S. Amodio, Segal Building, Atlantic City, N. J. Owners, E. Cooper & Sons, on premises. Architect taking bids due September 20th

Radial Brick Chimney, Woodbine, N. J. Architect, Division of Architecture and Construction of the Department of Institutions and Agencies, 137 West Hanover street, Trenton, N. J. Owners, Commissioner of Institutions and Agencies, 137 West Hanover street, Trenton, N. J. Owners taking bids due October 10th at noon.

Theatre, Arcade and Store Building, Kentucky avenue and Boardwalk, Atlantic City, N. J. Architects, Hoffman-Henon, Inc., Finance Building, Philadelphia. Owners, Stanley Co. of America, 1218 Market street, and Guilford's, Inc., 1038 Market street, Philadelphia. Brick, steel, concrete, stone and terra cotta, 170x190 feet. Preliminary plans in progress. Too early for details.

Terminal Buildings, Mechanic street, Camden, N. J. Architect, Samuel T. Wagner, Reading Terminal, Philadelphia. Owners, Philadelphia & Reading R. R. Co., Twelfth and Market streets, Philadelphia. Steel, brick and concrete, office building, 42x115 feet, concourse, 328 feet long, 105 feet wide, power house, brick, Y. M. C. A. building, offices, restaurant and waiting rooms, driveways, platforms, shelters, etc. Plans completed.

Residence, Brunswick, N. J. Architect, William Kleman, First National Bank Building, Trenton, N. J. Owner, Louis Brandt, 20 Belmont avenue, Trenton, N. J. Brick, 2½ stories, 16x50 feet, slate roof, hardwood and pine floors, hot water heat, electric light. Plans in progress.

Store and Apartment, Greenwood street, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owner, Philip Morgan, 1200 Greenwood avenue, Trenton, N. J. Frame, 2 stories, 35x75 feet, shingle roof, pine floors, hot water heat, electric light, tile work, metal bulks. Plans in progress.

Junior High School, Camden, N. J. Architect, Clyde S. Adams, 2038 Spruce street, Philadelphia. Owners, Board of Education, Camden, N. J. Brick, stone, concrete and steel. Preliminary plans in progress. Too early for details.

Pumping Station, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, City of Trenton, Commissioner Feel, Trenton Water Works, Trenton, N. J. Concrete, stone, 1 story, 40x80 feet, slate roof, concrete floors, electric light. Owners taking revised bids due September 29th.

Storage Building, Trenton, N. J. Architects, William Slack & Son, St. Regis Theatre Building, Trenton. Owners, County of Mercer, care of architects. Brick, steel, 2 stories, 73x77 feet, slag roof, concrete floors, electric light, rolled steel sash, fire doors, floor hardener, iron stairs, waterproofing and dampproofing. Architects taking bids due September 26th.

Church, West State street, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, Christian Science Church, care of architect. Frame and brick, 1 story, 40x80 feet, slate roof, hardwood floors (heating, plumbing and electric work reserved), tile work, ornamental plaster. Architect taking bids due September 22nd.

Stores and Apartment Building, Atlantic City, N. J. Architect, Vivian B. Smith, Guarantee Trust Building, Atlantic City, N. J. Owner, Ernest Beyer, Atlantic City, N. J. Brick, steel and concrete, 5 stories. Architect taking bids due September 25th.

Office and Stores (alts. and add.), 38 East State street, Trenton, N. J. Architect, Walter Hankin, 39 East State street, Trenton, N. J. Owners, Fisher Estate, Edward Fisher, care of architect. Steel, semi-fireproof, 4 stories, 19x65 feet, slag roof, pine floors, hot water heat, electric light, metal lath, hollow tile, tile work, rolled steel sash, roof ventilators, waterproofing, dampproofing. Architect taking bids due September 27th.

New Jersey Contracts Awarded

Stable (add.), 810-34 Carpenter street, Camden, N. J. Architect, private plans. Owners, Garden State Dairies, Supplee-Wills-Jones, Twenty-sixth and Oxford streets, Philadelphia. Brick and steel, 2 stories, 193x57 feet, slag roof, cement floors, metal lath, waterproofing, iron work, demolition. Contract awarded to George Kessler Cont. Co., 1733 North Marvine street, Philadelphia.

Boiler Room, North Broad street, Trenton, N. J. Architect, William Kleman, First National Bank Building, Trenton. Owners, Castania Dairy, North Broad street, Trenton, N. J. Brick, 1 story, 47x32 feet, slag roof, concrete floors, electric light, rolled steel sash. Contract awarded to S. W. Mather & Son, Greenwood and Canal, Trenton.

Club House (add.), 168 West State street, Trenton, N. J. Architects, Kleman & Kaplan, First National Bank Building, Trenton. Owners, Progress Club, Louis Kaplan, secretary, on premises. Brick, 2 stories, 40x90 feet, slag roof, hardwood floors, electric light, tile and marble work, metal lath, hollow tile, roof ventilators, rolled steel skylights. Contract awarded to J. H. Morris & Co., Broad and Hudson streets, Trenton, N. J.

Delaware Construction News

Bank and Office Building (alts.), Twenty-first and Market streets, Wilmington, Del. Architects, Brown & Whiteside, Dupont Building, Wilmington, Del. Owners, Wilmington-Brandywine Bank, care of architects. General interior alterations, hardwood floors, tile and marble work. Architects taking bids.

High School, Smyrna, Del. Architect, private plans. Owners, Board of Education, Smyrna Special District and Delaware School Auxiliary Association, Dupont Building, Wilmington. Brick, steel, concrete, 1 and 2 stories, 150x80 feet, masonry, carpentry, steel and iron roofing, painting (plumbing, gas fitting, heating and ventilating and electric work separate bids). Lowest bidders: A. L. Hudson, Smyrna, Del. (general), $157,800. Electric, E. F. Higgins & Co., 843 Tatnall street, Wilmington, Del., $3,798. Heating, plumbing and ventilating, T. T. Weldin & Son, 916 Orange street, Wilmington, Del., $24,125.

Miscellaneous Contracts Awarded

Residence, Washington, D. C. Architect, E. C. May, Dupont Building, Wilmington, Del. Owner, H. S. Meeds, Dupont Building, Wilmington, Del. Brick, frame, 2½ stories, 55x40 feet, shingle roof, hardwood floors, hot water heat, electric light, tile and marble work. Contract awarded to H. F. Karn, Rockville, Md.

Garage and Tenant House, Sohenin Manor, Cecil County, Md. Architect, Charles Barton Keen, Bailey Building, Philadelphia. Owner, Thomas F. Bayard, Wilmington, Del. Brick, 1½ stories, slate roof, hot water heating, cement and pine floors, electric lighting. Contract awarded to W. D. Haddock, Wilmington, Del.

Garage, Wilmington, Del. Architect, E. C.

May, Dupont Building, Wilmington, Del. Owner, G. P. Bisell, 7 Red Oak avenue, Wilmington, Del. Brick, concrete, 2 stories, 65x60 feet, slate roof, concrete floors, hot water heat, electric light. Contract awarded to J. E. Healy & Son, 707 Tatnall street, Wilmington, Del.

ARCHITECTS AND CITY PLANNING

BY THOMAS ADAMS

It goes without saying that the architect, by virtue of his training in the principles and practice of design, his cultivaton of the artistic and imaginative qualities, and his responsibility for the buildings of the city, is in a most important sense a city planner. Indeed there is some excuse for the claim that is sometimes made that, because he is an architect, therefore he is *the* city planner. History to a large extent supports that claim. When we read of ancient city plans we usually find reference ot the architects who planned them.

In more modern times we find the contribution of the architect to the greatest examples of city planning to be an outstanding one. Washington owes as much, if not more, to the architect as to the engineer and the landscape architect. The re-planning of Chicago was under the supervision of an architect. One of the most completely executed plans was that of New Edinburgh, in Scotland, which was laid out according to a competitive plan of Craig the architect and was built up from designs of the brothers Adam, Playfair and other leading Scottish architects of the period. The greatest achievement of Edinburgh was not the street system of Craig, which R. L. Stevenson criticized somewhat harshly and not altogether justly, but the arrangement and composition of the building groups facing the streets and squares. In a later competition for designs of extensions of Craig's plans the premiated designs were those of Playfair, Crichton, Reade and Nasmyth, all Edinburg architects.

In England there is only one firm of landscape architects that practices town planning but it includes an architect as a partner. Several architects and a smaller number of engineers (including surveyors) in Britain, have gained their reputation chiefly in the field of town planning. During the period of the writer's experience few important town planning schemes have been carried to completion without the aid of an architect. When the first Garden City Company was formed at Letchworth in 1902 designs were invited from two sets of two collaborating architects—one Parker and Unwin, and the other Lethaby and Ricardo. The second Garden City of Welwyn was first planned by Crickmer, an architect who gained his early experience at Letchworth. The writer has always been associated with an architect in any plans he has prepared, and would not attempt to make a plan without architectural assistance. That association has taken the form of co-operation with an architect like Lutyens as consultant or of employing capable architectural assistants. Where, by force of circumstances, the supervision of the collaborating architect was not maintained over the execution of the plan failure has resulted.

The professors of Civic Design at Liverpool and London University are architects. Perhaps the greatest town planning conference that has been held was promoted by the Royal Institute of Architects and the proceedings of that conference is a standard work of reference on town planning.

Much more might be said to the same effect to prove the necessity, first, for the collaboration of the architects in city planning, and second, the importance of specialized training for those architects who desire to practice city planning. Similar claims could be made for the landscape architect and the engineer, in respect of those parts of the field of city planning which is properly their own. In a previous article it was shown that the field was wide enough to require the contributions of members of all three professions, with such legal aid as may be needed.

City planning will advance as an art and develop as a science all the more rapidly if it is recognized that it cannot be monopolized as a practice by individuals working alone. No doubt differences of opinion will always exist as to the relative degree of responsibility of different members in a group, but, once the general principle, that the field is one for co-operation of specialists, is accepted the relationships between the specialists will soon adjust themselves.

Acertain aloofness to city planning by American architects may be ascribed in part to two reasons—one, the lack of appreciation on their part of the need for co-operation with others, owing to a disregard of the scope and ramifications of the factors to be dealt with in the modern city plan and, two, (both a cause and effect of the first), a lack of special training in city planning.

Architectural Matters to Be Considered in City Plan

To return, then, to the question with which we started, what are the factors to be considered by the architect in the city plan?—remembering that the modern American city is a peculiar urban agglomeration growing up on a democratic foundation and without any precedent for the character of many of its problems.

It has to be studied and planned from sociological, economic and aesthetic viewpoints. Among the objects of the plan are healthy living conditions, economic use of the land, convenience for the means of transportation and distribution, order and beauty in structure and natural feature. The facts have to be known regarding topograhphic, social, climatic, hygenic, historic and economic conditions, and the relation between these facts have to be ascertained to get the foundation of knowledge necessary to plan.

The renaissance of cities cannot be accomplished by schemes for architectural treatment of their structural growth—such as the treatment of monumental civic centres, any more than by the widening of streets or the laying out of park systems. These matters have to be dealt with in proper order, but there must first be study of the underlying elements in city growth—living conditions, industry, and control of land development,—next has to be considered all the services of the city,—transportation, drainage, water supply, power, educational and recreation facilities, public open spaces and public buildings.

To begin with, whether or not the architect is co-operating with the lawyer, he needs to know something of the State laws and city charters governing safety, construction of adjacent and related buildings, building set-backs, zoning and creation of city plan commissions.

He has to investigate the effects of social and industrial factors, ascertained in surveys, on height, use and character of buildings; the influence of land tenure and methods of sub-division of blocks and lots on the arrangement, density and character of buildings erected or to be erected; the historical factors that have promoted, retarded, or changed the type of buildings; the location and reciprocal relations of industrial, business and residence buildings.

He has to study conditions regarding local types of dwellings and their improvement; the relation between urban and rural development; planning of small sites for dwellings and community centres; the relation of width of street to height and bulk of buildings and between elevation of buildings and street grades. Other matters to be dealt with from the architectural point of view are treatment of building set-backs and encroachments on sidewalks: general distribution of buildings of different character; use of alleys; private restrictions in residential areas; apartment houses, garages, theatres and other special types of building.

There are still left the big civic problems of an architectural character relating to railway termini and their approaches; market buildings; bridges, buildings in parks and athletic fields,

groups of buildings for municipal, educational, hospital and other public purposes; waterfront buildings; and generally the placing, arrangement and surroundings of public and quasi-public buildings, the approaches to these buildings and their connection with the park system and main entrances of the city.

All of these matters require to be considered by an architect in collaboration with the landscape architect and engineer. The architect needs to know something of all of them so as to enable him to cooperate effectively with the group whose combined knowledge should enable them to prepare the comprehensive plan. If, as seems certain, the planning of cities is going to be more actively promoted in the future, we have to consider what special equipment of knowledge the young architect needs to make him competent to undertake his share of the work of planning cities.—*Journal of the American Institute of Architects.*

WEATHER PROFITS IN BUILDING

BY V. L. SHERMAN

Weather Conditions Have a Big Influence on Builders' Profits. Herein are Valuable Points on How to Make Use of the Services of the United States Weather Bureau and on the Character of Service Rendered

If the builder, especially the year-round builder, would follow the daily forecasts and weather maps he would have fewer regrets after a passed mild spell, or thrown rafters after a high wind, fewer idle men during a wet season and protection against severe weather and extreme cold. If underwriters decline risks on houses with unclosed doors and windows, why shouldn't the builder protect himself, as he very well can in most cases, against both wind and rain, if given warning. Painters' work can often be arranged for minimum delay when the prospect of rain and its duration are known. Every one must take a chance, of course, but I know of four excavations for dwellings, half dug 12 days ago, that have been and are now brim full of water, and will remain full of water for another four or five days unless they lay the sewer.

Weather the world over travels toward the east, in this country at the rate of 450 to 500 miles a day. Generally speaking, weather is affected in two ways, by high pressure areas and by low pressure areas. The "lows," or cyclones (not tornadoes), are shown on the weather-map as a more or less concentric group of isobars. The isobar (i. e., equal barometer) is a line connecting points on the map at which the barometric pressure is the same. The wind flows into the "low" in a counter-clockwise direction, spiraling up from the ground and spreading in the cold upper air. Should a trough of low pressure form, the wind flows north toward it on its approach and follows south as the barometer rises. The moisture carried up from the earth's surface condenses, forming clouds, and is often carried high enough and far enough ahead of the storm to form visible cirrus clouds. These clouds, made up of ice particles, may be so thin as to present only a glare in the sun or a light ring around the moon. Rain or snow do not always accompany a low spot, but the the temperature usually rises on its approach, and during the warmer weather thunderstorms, and occasionally tornadoes, form in the southeast quadrant of the area. North of the "low" sharp thunderstorms often appear in the "break," or dip, of the barometer.

Anti-cyclones, or "highs," invert the procedure, the cold upper air spiraling down in a clockwise direction and spreading over the earth. Highs generally alternate with lows, but just as the low-spots tend to drift a little north of east, so do the highspots seem to drift south. The rise in the barometer brings fine clear weather in the east, but in the west, especially around the Great Lakes, it may be blowy and cloudy with a little rain. The writer has seen the wind box the compass four times in four days without a let up in rain, so what is the use in guessing?

Every morning at 7, central time, 150 stations throughout the United States and Canada record the readings of their instruments, the barometer, maximum and minimum temperature, precipitation; wind direction and velocity and atmospheric conditions. Six Alaskan stations record at 11 P. M. central time, and there are also stations in the Hawaiian Islands. These readings are telegraphed to the district offices where they are cleared for every district in the country. The official forcasters gather all these readings on a map, drawing isobars through points of equal barmetric pressure, and dotted line, called isotherms, through points of equal temperature. The interpretation of these weather maps of the country, which are made twice daily, from morning and evening readings, is the weather-man's task. To forecast the track of the storm he must know the topography of the country over which the storm is passing, the attendant conditions, and the probable effects of the weather upon it from all around. And each weekday the district forecasters make two predictions. The earlier one is telegraphed to the various stations from which printed forecast cards are mailed to every postoffice and subscriber. In this way anyone within telephone call of a postoffice may have his informaton with the earliest. During the colder months frost and minimum temperature forecasts accompany the weather forecasts. From the district offices weather maps are mailed every morning which contain general as well as local forecasts, shippers' advice, and highway bulletins. At the end of every month the district offices mail out complete summaries of the weather with hourly readings for each day, averages and comparisons. These sheets are quite vauable to the builder in comparing notes on work done and in planning ahead.

A remarkably small investment of a builder's time and cash will keep him in constant touch with his district office and will pay tremendous dividends.—*National Builder.*

THE PHILADELPHIA BUILDING CONGRESS

Organized August 10th, 1922, affords a co-operative medium, if properly encouraged by financial support and personal effort, for accomplishing to the great advantage of Philadelphia and its citizens, the following vitally important

Program

First—To further co-operation in the Philadelphia district among the various groups which are engaged in or are directly affected by the building and construction industry. These groups include not only architects, engineers, contractors, sub-contractors, and construction labor, but also manufacturers of and dealers in building materials and equipment and representatives of financial interests, surety and insurance companies, Railroads and other Public Utilities, Real Estate and Building and Loan Organizations, Federal, State and City governmental agencies and also the public.

Second—To survey buildings and the construction situation in its entirety, and outline methods whereby the different groups may further the general purpose of stabilizing the industry and of meeting specific problems as they may from time to time arise.

Third—To study in particular the employment problem in the building and construction industry, and to recommend means by which seasonal unemployment may be reduced and the employment situation may be given stability both during periods of industrial depression and of industrial prosperity.

Fourth—To co-operate with similar organizations and congresses in New York, Boston, Seattle and elsewhere and with the American Construction Council.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

As The Editor Sees It

ADDRESS OF WILLIS H. BOOTH, VICE-PRESIDENT, GUARANTY TRUST COMPANY, NEW YORK, BEFORE THE AMERICAN CONSTRUCTION COUNCIL, WASHINGTON, D. C., JUNE, 19, 1922.

There are so many kinds of business, which, broadly speaking, enter into the construction industry, and these in turn are affected by so many divergent interests that it is a really great task to endeavor to gather them co-operatively together. But this very fact that the component parts of construction are scattered in interest and direction emphasizes the importance of an effort to assemble them so that they may function to good purpose.

This meeting is only the natural culmination of a movement which has been agitating the business world in recent years when we have been struggling and striving, and not always sure where we are going either, to work our problems out. We have seen that co-operation in labor is necessary but that it may be badly guided and become a public peril; that co-operation in capital, while it might be wise under proper direction, becomes distinctly contrary to the public good under evil direction. The same applies to agriculture. The task of co-operation which shall bring into play those forces which make for good and shall eliminate by the combined weight of public opinion and of law, those forces which make for evil now rest heavily upon all of us. Nobody wants a country stratified in its interests, with hard lines of demarcation between labor, industry and agriculture, for the very obvious reason that one cannot exist without the other.

You who represent the various phases of the widely diverse construction industry have, therefore, had this brought home to you more definitely than have some other lines of business. It is this realization which brings us here today in an effort to set in motion a new machine having for its great purpose the co-ordination of capital, labor and management in the constructon field for the benefit of the industry and for the public good.

Differing from most easily determined industries and, at the same time, touching or comprehending practically all industry, construction has been a hard line of business to get into intense co-operation. It is so widely scattered in its character that it has been obliged by force of circumstance to gather itself into a great many groups, each representing a phase of the business. This was one of the steps in the evolution that has brought us by perfectly normal stages to this meeting this morning. It would be perfectly impossible to endeavor to accomplish what measures up to the ambition of this meeting if we had not previously organized national trade associations of one character and another, which in the main comprehend the entire industry. These trade associations when legitimately operated surely serve a most useful purpose. We must not blind ourselves to obvious conditions. The construction industry has here and there some housecleaning to do. It is very much better that it be done within its own ranks. It is equally within reasonable expectation that if this council is broadly supported it can crystallize business practices and policies within the trades that will prevent unfortunate criticism in the future.

I appreciate full well that it is not going to be an easy thing for any council of men, no matter how intelligent they may be or how fair their method of selection, to gather together at any time and be able to guide all of the factors in such a great industry as this. There are so many branches of the business. In most cases manufacturers do not produce a finished product but only a semi-finished product, so far as its ultimate use is concerned. Construction materials, broadly speaking,, are but raw materials, and construction equipment but tools. And then the contractor comes in and, whether it be a building or a bridge, a highway or an ocean liner, by assembling the raw materials and equipment and labor and executive direction, he produces the ultimate structure. It is only necessary to recite these component parts of raw material, labor, equipment and executive direction to emphasize again their

BLUE PRINTS

mutual dependency. The executive direction implies the business management of the contractor associated with the highly technical skill of the architect and engineers in the various lines of engineering. As the matter now stands these component elements are thinking of construction largely in the light of its particular interest to them. This is natural. But in forming this council we appeal to a more enlightened selfishness and feel confident of support on the basis of a more intelligent service to the public. It is this intelligent co-operative service which we hope to demonstrate will be of great practical value to every individual whose contact reaches to the construction field. This council is designed to be primarily a practical thing. The construction industry is not devoid of vision. No one who builds anything can do so without vision. We know that if this movement can be worked out to its ultimate that the entire standards of construction operation will be bettered and relationship with the public be even greater increased in confidence and respect.

But just as we had to reach to the council over the road of trade associations, in the same way this council must reach its ultimate ambition over the road of quietly and gradually developing cooperation between labor, material, equipment and management. In setting up the organization we are only doing a roughing-in job. We are perfectly familiar with the fact that as matters stand now the manufacture of any of the various materials entering into a job has little or no direct responsibility to the owner. The professional advisers have the aloofness from both the manufacturing and contracting branches which naturally comes from the contrast between professional and commercial standards. The contractor is not a free agent of the owner, but works under the direction of the architect and the engineer. In some cases he is forced to undertake a contract which, while appealing to professional direction, is not mutually advantageous as between the contractor and the owner.

Up to this time there has been no clearing house for these differences of viewpoint. No place where the representatives of each line of effort court sit down and talk the matter over, fully confident that he would be not only accorded a fair hearing, but that he would be properly represented in any decisions that might be reached. Of course, no judgments can be reached except on matters of policy. It is these great matters of policy that make the framework of all our industrial relations.

When we think about policies and want to make up our judgments we must ascertain the facts. And so we find that before we can make a judgment covering a policy in the construction business, or in any other business, we must have before us the statistical information which, coupled with our practical experience, gives us the groundwork upon which conclusions may be based. This council then naturally becomes a clearing house for the information contained in the industry as a whole. Theoretically this is simple. Practically it is not going to be so easy. But I have every confidence that step by step it will prove its vaule, will develop the support and cooperation of the component parts of the industry, and ultimately will be so equipped as to have first-hand information on all the elements of vital importance in every phase of the construction business. If this council endeavored to do no more than would be contemplated by this effort, it would, it appears to me, offer every reason for its existence.

There is nothing more dangerous than half truths. When this Council endeavors to compile the statistics of an industry it must be very sure it has gathered every possible bit of information available, and then must give the same out frankly and completely, whether it affects the industry advantageously or not. This is the only way that confidence will be developed, and this council will rise or fall in its effort entirely upon the confidence which is engendered and the value which the public, no less than the component parts of the industry, places upon its observations and recommendations. This statistical information,,, if properly compiled and gathered as it must be from the trade associations and the departments of the government directly assocated with these matters, can be of estimable value to those manufacturers, especially the smaller ones, whose business it is to provide the supplies for the construction industry. I am fully aware that this situation has been well cared for, particularly in specific lines, but I am advancing the hope that the council will be able to develop itself into a clearing house of statistical information for the whole industry that will be of inestimable value to everyone connected with it.

This Council, too, representing so completely all of the various phases of industry, should be powerfully instrumental in having the construction business appreciate its own magnitude and importance and its effect upon the prosperity and well being of the nation. This would have the natural result of inspiring at least a portion of those engaged in the business to a kind of dual business patriotism, a patriotism on the one hand which would make them take pride in and be loyal to the business which makes

Reliability
In Electrical Work
is appreciated by both large and small builders and operators. For instance, the City of Philadelphia has recently given us an order for installations on the new Frankford "L."
Certainly a fitting example of what we name:—

Waterproofed with
Trus Con Waterproofing Paste

Trus Con Waterproofing Paste (Concentrated)

Is a scientific product, developed by our technical staff. It is used in practically all the large operations throughout the country. Mixed with the tempering water, it contributes powerful water repellent qualities, but does not weaken the concrete nor interfere with the normal development and setting of the cement.

Residence, South side Afton, East of Verree road, $4,800. Architect, private plans. Owner, Charles Braun, 1020 Hellerman street,

CONTINUOUS CONCRETE MIXER

What do you think of a machine that will **accurately** measure its own proportions and **thoroughly** mix, at the rate of 27 cubic yards per hour, with a 1½ horse power engine? With the batch mixer, there is a great temptation, in order to increase the output, to slight the mixing. With this machine, such a thing is impossible, because the stuff cannot be gotten out till it comes out of itself; beside, proportions are more accurate.

With the "Batch" method, the measuring is done in wheelbarrows, and no two barrows have exactly the same quantity in them.

We will tell you more about it later.

Contract awarded to Moore & Co., Nineteenth and Cherry streets, Philadelphia.

School, Gloucester Heights, N. J. Architect, Charles R. Peddle, 136 South Fourth street, Philadelphia. Owners, Board of Education, James R. Y. Blakely, secretary, Westmont, N. J. Brick, cut stone and steel, 2 stories, 86x25 feet, slag roof, cement and pine floors, waterproofing, iron work, electric lighting, metal lath. Contract awarded to Friel-McLeister, Inc., 2146 East Norris street.

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., September 18, 1922. Sealed Proposals will be opened in this office at 3 P. M., October 16, 1922, for construction (except mechanical equipment) of an Infirmary Group (four brick and concrete buildings two and three stories, with a total ground area of 44,600 square feet) for the United States Veterans' Hospital, at Chelsea, N. Y. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. Proposals will be considered only from individuals, firms or corporations possessing satisfactory financial and technical ability, equipment, and organization to insure speedy completion of the contract, and who have established a record for expedition on contracts of similar character and magnitude. Before drawings and specifications are forwarded to prospective bidders, applicants must cite at least one specific instance where a record for speed has been established on a job of equivalent magnitude, giving date of award of contract, amount of contract, specified time for completion and date of actual completion. The fact that any concern obtains a set of the plans and specifications from any source whatever and submits a bid shall not constitute a waiver of the foregoing stipulations. Jas. A. Wetmore, Acting Supervising Architect.

Business is founded on reciprocity and co-operation. Any other plan than this spells bankruptcy. The successful business nowadays has a heart and a soul.

At the annual election for officers and directors of the Philadelphia Builders' Exchange and Employers' Association, the following were elected:

President, Joseph M. Steele; First Vice President, John S. McQuade; Second Vice President, William M. Anderson; Third Vice-President, John P. Holleran; Treasurer, George J. Watson; Directors, John F. Buchanan, C. Stanley French, O. W. Ketcham, Amos Y. Lesher, J. Walter Maxwell, W. Nelson Mayhew, Joseph F. Summerill and Barclay White.

(Continued from page 616)

their daily occupation and, on the other hand, be conscious of and loyal to a sense of general public service and public responsibility. I am not speaking as an altruist, nor dreaming dreams of intangible things. We must learn in this business, if we have no already done so, that all large corporate interests have learned in their specific fields. The old days of figuring that we can operate our business without regard to the public have passed away, and the large corporations that are doing the best are those which are working in sympathetic co-operation in the enforcement of laws which recognize the public rights and in operating their businesses in full accord, four-square, with rational public sentiment. Of course, this would naturally develop a business consciousness, a sense of obligation in the wake of which would come more reasonable corporation throughout the entire business.

And at this point the public would come in. The abuses which have beset this industry, as they have beset all other industries, would be gradually cleaned out from within and a permanent set of business morals established which would prevent a repetition of practices which seemed to give temporary advantage, but which, in the long run, are, from a strictly business point of view, unprofitable. In the last analysis the public pays the price. Of that public we are all a part. We like to criticize the other fellow's business but we don't like him to criticize ours. But we can't prevent such criticism, no matter how we try, if it is warranted by the facts. The clear common sense of the situation then, is to put our own house in order to clear ourselves of criticism, and then to criticize the other fellow's business as freely as we wish until he in turn has done exactly the same thing.

There is no end to the practical things which may be done if we have the patience to work them out slowly. Our greatest trouble in all co-operative efforts is that we try to be independent of human equation and to endeavor to reform the world overnight, but we have reasonable expectation by the proper adjustment of the work of each craft to give us a lengthened construction season. It may not be too much of a vaporous dream to hope that ultimately we may develop such a sufficient mutual confidence as will prompt labor to co-operate in the lengthening of the number of productive days per year per man in the construction industry of this country.

It may also be possible at the same time and by the same character of co-operation to expand the apprentice system so that we may have the ranks of skilled labor continually augmented by the oncoming generations.

I keep continually coming back in my thought to a sense of this feeling of public responsibility, because I can see this Council in the great functioning which is before it exposed to the danger of thinking too exclusively in construction terms. The resulting stratification is something which we must all deplore. So when we urge this council as a means by which the industry may become articulate and represent its viewpoint to the public, we do so with the full appreciation, first, of the necessity of this articulate capacity and, second, with the appreciation that it must always consider the public interests in its expression. This does not involve entire unselfishness; it only contemplates enlightened selfishness. With this in mind, it would be a service of inestimable value if the construction industry were able to present to the transportation industry of the country a proper picture of its needs and of the service which it had a right to expect. It also would be of the greatest value if it could give public expression to its views on the financial operations of this country, because our banking structure, as a clearing house of all business, needs whatever information it can get from reliable sources. In this country we are now engaged in the task of taking a nation whose economic life was largely based upon agriculture and adding on two this agricultural base a superstructure of industry and getting the two to mould together. Between these two great forces, the agricultural and the industrial forces of the country, the banker is obliged to operate. He must provide capital for the initial production of wealth and he must direct the wealth into profitable employment after it has been produced. His position becomes one of great responsibility, and his responsibility to the public is always being impressed upon him.

Of course, there are many sides to the banking business as there are to the construction business and this is not the time or place to go into an intense analysis of of the different methods of operation. But it is in line with the topic under discussion to emphasize the fact that he must at all times conduct his business so as to command public confidence. Looking at the construction industry through the banking glasses and with the public interest generally in mind, it becomes obvious that the public cannot be adequately served when an industry lacks a class consciousness and the feeling of the responsibilities which go with its position. When the aims are not concentrated but are diffused through the various branches, such branches oftentimes being antagonistic to one another, such group interests and group antagonisms subordinate the rights of the industry as a whole and the public whom it serves. When specific groups within the industry insist upon doing things which shock the public consciousness, all of the industry must suffer by such action. Let me emphasize again, then, that the great co-operative movement which this council hopes to accomplish should result in the elimination of practices which, while beneficial to one group within the construction industry, are disastrous indeed to the industry as a whole.

This council then will also have a dual character of operation. First, it must use its influence within its own industry and, second, it must interpret that influence and that industry to the public. It must give the public an adequate picture of what the construction industry is, how it functions, the extent and character of its obligations, its ultimate needs in the way of legislation, and its determinaton to elminate bad practices from its business. It does not take many words to outline this little program, but to endeavor to fulfill it is a task which requires the greatest ability, the great devotion and, I might also add, no small amount of contribution. We know what the result will be if the building industry will do exactly what public utilities throughout the country have done in a very large way, that is, win the confidence of the public by taking the public into its confidence, create a more stable industry—and stability in industry is just as important to the public as it is to the members of the ndustry themselves. An excessive inflated condition on the one hand or a depressed condition on the other are equally unfortunate. Actual stabilization is, of course, impossible, but efforts which tend towards stabilization are not impossible, and every bit that is accomplished adds immeasurably to the public good. In the establishment of confidence and in the improvement of stability all phases of the industry will feel more sure of their position, and this great industry will more nearly come in to its own.

It is a great work full of alluring prospects and depending for its success upon the integrity of purpose and the unselfish devotion which guides it. Business is going to have its ups and downs. Conditions are very unsettled throughout the world, our situation at home, as we all know, is very largely dependent upon what happens elsewhere, but through all of this if we keep our feet on the ground and our hearts in our work, this council can go on to do constructive and practical things day by day under most magnificent leadership. I congratulate you upon your president.

I feel confident that if you all can put your hearts into the work, remembering that a nation without vision shall perish, and then stand fast, stand firm and stand true to do practical things of enduring value, you will have served to the maximum the industry to which your time is

devoted and the nation to which your lives are pledged.

In response to the many urgent requests from the representatives of the building industry in and around Philadelphia, Chairman John N. McGarvey last week formally announced the date for the second annual Building Exposition to be held under the auspices of the Philadelphia Operative Builders' Association. The date selected is the first week in April, at which time building operations are in full swing for the spring. The event will mark the second exposition held in this city and all indications point to the greatest and most representative exposition of all phases of the building industry. The tremendous success that attended last year's Exposition has influenced the committee to repeat the Building Exposition for 1923.

Thousands of Philadelphians are in the market for homes and this exposition will offer an unrivaled opportunity for them to learn how, when and where to buy or build. From an educational standpoint the exposition will be a revelation and many new and interesting features will be introduced during the week of the exposition.

The primary object of this exposition is essentially a municipal one. The housing situation has become pecularily acute and it is necessary to find some means to relieve it. Builders are displaying more activity at the present time than ever before in the history of the industry, and will be for the next two or three years. Philadelphians are looking forward eagerly to this opportunity to learn the best and most economical method in purchasing homes.

During the next six months, firms identified with building material of all kinds will be busily preparing displays and collecting information relative to home building and preparations will be made to furnish information during the week of the exposition to the many thousands of prospective home buyers. The exhibits will show every feature of the building and furnishing lines and there will be many novelties introduced.

The home building interest will be sustained throughout the exposition, which will present a panorama of buildings for the prospective builder. The latest improved equipment as well as materials will be displayed. Bathroom fixtures and equipment, lumber in virgin state and finished condition, stoves, furnaces, ranges, hardware, electrical equipment, plumbing supplies and labor saving devices will be among the many displays at the exposition.

Kitchen equipment of all kinds and materials that go into the building and maintaining of homes will be features.

Chairman John N. McGarvey, upon whose shoulders the bulk of the work of the exposition will fall, together with the fellow members of the committee, rendered the public a great service last winter by bringing before those interested the real conditions of the building industry. In discussing the exposition, Mr. McGarvey said:

"In spite of the efforts of the builders during the past year much is yet to be done to relieve the housing situation and that the public may intelligently understand conditions the exposition management will arrange for information regarding home construction which will be of inestimable benefit to prospective purchasers. To those who contemplate the early erection .of homes or the purchase of the same after they have been built by the Philadelphia Operative Builders, the exposition will be of practical assistance.

"A conservative estimate of the attendance at last year's exposition places the number at 100,000 persons. The 1923 exposition, which will offer so many acceptable hints and suggestions, will bring together a great gathering of architects, builders, engineers, contractors, property owners, while the entertainment features will more than compensate the visitors for a trip to the exposition."

That all persons interested in building will have an opportunity to obtain information without cost, admission will again be free and Daniel Crawford, Jr., president of the Philadelphia Operative Builders' Association, has guaranteed the greatest possible co-operation of his Association with the movement. A feature which will be of particular interest to the exhibitors as well as the public will be the appointment of committees from the Philadelphia Operative Builders' Association for every evening during the exposition, which will insure a full attendance of builders at all times.

HARD FACTS ABOUT CONCRETE

The Slump Test is the simplest and most practical way of determining the proper amount of water to use in mixing concrete.

The correct cement-water ratio for any concrete mixture will develop the maximum strength of the concrete. A knowledge of how to determine this ratio is a matter of importance to the builder.

The slump test is a simple, easy, and practical method of making this determination. The only apparatus necessary is a special mold, made from sheet metal preferably non-corrosive, in the form of a frustum of a cone 4 inches in diameter at the top, 8 inches in diamter at the bottom, and 12 inches in vertical height.

After thoroughly mixing the concrete is placed in the mold in three or four successive layers, each layer carefully puddled or rammed with a blunt-pointed 5/8-inch round rod. The metal mold is then removed with a steady, vertical lift, leaving the concrete free to spread at the base. The "slump," or reduction in vertical height of the pile of concrete which results, is an indication of the consistency of the mixture.

The consistency which produces concrete of maximum strength is known as a "normal" mixture, and has a slump of about one inch. A reduction in the amount of water of 10 per cent. below that required for a normal mixture will change the slump to only one-half inch, and *decrease the strength of the concrete about 30 per cent.* Increasing the water 10 per cent. above normal will result in a slump of almost three inches, and *a loss of at least 15 per cent. in strength.*

A portion of the strength of the concrete must sometimes be sacrificed in order to obtain the plasticity of mixture required by the manufacturing processes employed. For pavements, floors and large foundations, the slump should not exceed 3 inches. For thin, reinforced concrete walls where smoothness is required but compacting is difficult, a mixture with a slump of 6 or 7 inches is permissible because its wet consistency practically eliminates the necessity of tamping. *Remember: Do not make your mixture more plastic than is required by the nature of your work.*

—*Concrete Builder.*

Statement of the Ownership, Management, Circulation, etc.

Statement of the ownership, management, circulation, etc., of The Builders' Guide, published weekly at Philadelphia, Pa., required by the Act of August 24, 1912, for October 1, 1922.

Editor, H. L. Sharpe.

Managing Editor, none.

Business Manager, Louis S. DeLone.

Publishers, Building News Publishing Co., Perry Building, Philadelphia.

Owners, Louis S. DeLone, 6419 Drexel road, Philadelphia; Samuel R. McDowell, Narberth, Pa.

Known bondholders, mortgages and other security holders holding one per cent. or more of total amount of bonds, mortgages or other securities, none.

(Signed)

Building News Publishing Co.,
Louis S. DeLone, Business Manager.

Sworn and subscribed before me this 16th day of September, 1922.

Hugh Roberts, Notary Public.

(My commission expires April 15, 1925.)

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—Elbert Hubbard.

As The Editor Sees It

A PERNICIOUS PRACTICE

Great Need to Stop Revision of Proposals After Owners Have Received Them

How to eliminate one of the most pernicious practices in the construction industry—the revision of proposals after bids have been received by the owners—is a difficult problem engaging the Associated General Contractors.

One case has just arisen where a member submitted a bid on important work, which was considerably lower than any other. The bids were opened before the bidders, but the owners, wishing to reduce the cost, asked for new bids after specifying certain minor changes.

This is an example of what was a greater practice previous to the establishment of the Associated General Contractors and its influence in attacking it than is the case now. Advantages have been taken of the individualistic nature of contracting and contractors in what was almost a universal practice of making contractors enter into price-cutting competition by first receiving bids, and then making minor changes in the plans and specifications, with the expectation that eah contractor would take a slice off his profit.

Various Ways to Overcome Practice

This situation has been overcome in different ways. In one locality, the contractors filed a copy of their proposals with the secretary of their local association with the understanding that after bids were opened by the architect the figures filed with their association would be available to every member and that no contractor other than the low bidder should submit additional figures for modification unless such modifications amount to over 0 per cent. of the figure bid.

In another case it was understood that the first, second and third bidders submit figures on modifications.

In still another instance, the contractor refused to alter their proposals and would not submit figures on modifications until after the contract had been awarded.

Going on the assumption that all who are competing would act in a business-like manner, the low bidder could submit a revised proposal based on minor changes without further cut in his estimated profit. He could persuade his competitors to refuse to submit further bids as long as he was low.

A job without profit is worse than no job at all.

DWINDLING FORESTS FORCE DECREASED USE OF LUMBER

If the food consumed by each man, woman, and child were reduced by one-third, the pinch of hunger would soon be felt and the cry of famine undoubtedly raised.

Yet substitute the word "wood" for "food" and you have exactly what has happened in the use of lumber. The per capita consumption has dropped from 500 board feet in 1900 to 316 board feet in 1920, says the Forest Service, United States Department of Agriculture.

This decreasing use of a fundamental commodity, according to forest experts, is not a result of decreasing needs but a result of forest exhaustion. It is not being accomplished without economic hardship or without curtailment of industrial expansion. It is not a temporary condition that will automatically adjust itself, for even at this reduced rate of consumption we are still cutting our forests more than 4 times as fast as they grow. The situation proclaims, according to the Forest Service, that if we are to remain a nation of timber users, we must become a nation of timber growers,

Reached Highest Point in 1906

In 1906, when American lumber production reached its highest point, the average per capita consumption of lumber in the United States was approximately 500 board feet. Since that time the per capita consumption has rapidly and consistently decreased until in 1920 the average citizen used approximately 316 board feet. This is a reduction of 37 per cent. in 13 years, or nearly 3 per cent a year. Should this decrease continue at its present rate, by 1940 the downward sweep of consumption would approach zero. This, of course, will not happen. The average consumption will ultimately

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 3519

BLUE PRINTS

reach a fairly stable level, which will depend mainly upon the extent to which our devastated forests are made again productive.

The consumption of lumber is not evenly distributed . Previous studies indicated that the States of the Pacific Northwest, now the last great stronghold of big lumbering operaions, had a much higher per capita consumption than those of other regions, but the present figures are the first to give information for all States upon the same basis. Naturally the greatest per capita consumption occurs where wood is plentiful and the population is relatively small. In Washington and Oregon the consumption appears to be between 900 to 1,000 board feet annually per person.

Next come California, Montana, Idaho, and Wyoming, where the rate of consumption is from 500 to 800 feet per person annually. In these States timber is relatively plentiful as compared with the density of the population, and a very considerable expansion has been taking place in the development of farms and other natural resources.

The group next lower in per capita consumption includes the Lake States, and sweeps southwesterly across the prairie States through Colorado, New Mexico, and Arizona. In this group the annual consumption is between 300 to 500 feet board measure.

Use Less Than 300 Feet

Practically all the remaining States fall into a class in which the annual consumption is 200 to 300 feet. This group extends in a broad belt from Texas along the southern and eastern Atlantic Coast to Cape Cod, Mass. It also includes North Dakota, Iowa, Utah, and Nevada.

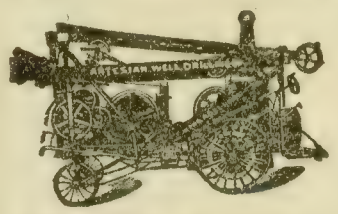
The lowest consumption of all is in Rhode Island, the District of Columbia, South Carolina, and Georgia, in which the average consumption is rated between 100 to 200 feet per year. In the District of Columbia there is an extreme situation in density of population. No lumber is produced, there is little farming or manufacturing, and the entire population consists of urban dwellers in the city of Washington who live mainly in houses of brick and stone and require relatively little lumber. All the lumber used in the District of Columbia is imported from other States, just as it is in some of the non-timbered prairie States.

In general the older and more densely settled States show the lowest average consumption. The States characterized by heavy agricultural operations come next, and the greatest use per individual is indicated in those States where there is still considerable timber and where the extension of home building is proceeding at a rapid rate, using the abundant material provided by the forests. The States are going through an evolutionary process, building first of lumber and later of more costly materials as the forests recede before fire and axe.

THE PLASTER EXPERT ON THE JOB

It is assured that every plasterer knows how to apply gypsum plaster. You know, for instance, that if the plaster is sagging and sliding it has been mixed too thin—but suppose the water is reduced and the plaster still sags, then what? You know that if the plaster is working too stiff more water is needed—but suppose the water is added and the plaster still pulls? Or, you know how to straighten up a wall so that the plaster wil be uniformly strong, but do you know the seven other causes of weak or cracked walls, assuming the plaster to be a perfect quality? More important still, when you have located the cause of the plaster sagging, working too stiff, or cracking, do you know the easiest, quickest, cheapest and most effective way of remedying the trouble?

There are two general classes of plaster troubles: First, troubles with the working qualities of the mortar; second—and by far the greater number of the two—troubles with the completed walls. Records show that if you use a mill-tested plaster, most troubles with working quality and all troubles with set walls are caused by something other than wrong plaster. Let us first consider the three troubles that have to do with the application of the morar—quick set, slow set, and short working.



Quick Set

Suppose the plaster commences to stiffen before it can be applied. First, see if the mortar box was cleaned after the last batch was mixed, and if the tools were cleaned. because there is hardly anything that will cause plaster to set so fast as set plaster. Next, did the mortar mixer wash the tools in the water barrel that supplied water for the mix? That would cause quick set. Is the water clean? It should not be stagnant, and it better be from a well or hydrant. If water be heavily treated with alum it may be clear and still cause quick set. Examine the sand. If it is too fine, or dirty (more will be said about sand later), it will cause quick set. It's dollars to doughnuts that correcting some one of these conditions will remedy the trouble. But even if you cannot locate the cause, it's easy to make the plaster set slower.

Send to the manufacturer for some retarder and sift this over the top of the plaster and mix thoroughly. If you haven't time to get retarder, make a solution of 2 lbs. of glue to 40 gallons of water

(Continued on Page 644.)

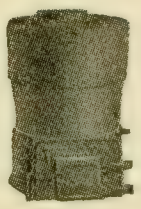
Wyoming avenue, $5,000. Architect, private plans. Owner, Harry A. Barth, 4701 Rising Sun avenue, Philadelphia. Brick, 1 story, irregular size, slag roof, cement floors. Owner will build.

CONTINUOUS CONCRETE MIXER



What do you think of a machine that will **accurately** measure its own proportions and **thoroughly** mix, at the rate of 27 cubic yards per hour, with a 1½ horse power engine? With the batch mixer, there is a great temptation, in order to increase the output, to slight the mixing. With this machine, such a thing is impossible, because the stuff cannot be gotten out till it comes out of itself; beside, proportions are more accurate.

With the "Batch" method, the measuring is done in wheelbarrows, and no two barrows have exactly the same quantity in them.

We will tell you more about it later.

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls — *For Preserving Brick-Stone-Stucco-Concrete*

THE TRUSCON LABORATORIES

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

established a record for expedition on contracts of similar character and magnitude. Before drawings and specifications are forwarded to prospective bidders, applicants must cite at least one specific instance where a record for speed has been established on a job of equivalent magnitude, giving date of award of contract, amount of contract, specified time for completion and date of actual completion. The fact that any concern obtains a set of the plans and specifications from any source whatever and submits a bid shall not constitute a waiver of the foregoing stipulations. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 2, 1922.—Sealed Proposals will be opened in this office at 3 P. M., October 30, 1922, for alterations, etc., to the United States Post Office, Court House, and Custom House, at Richmond, Va., including alterations to adjoining buildings and approaches. Drawings and specifications may be obtained from the Custodian at Richmond, Va., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

Think Right Quickly

of some one thing you use in your business

Then think of this!-

"The War Department has it."

And the chances are better than 10 to 1 that the War Department has all the things for crowd-getting sales you can call to mind in an hour's steady thinking.

What does this mean to you?

It means, simply, that War Department sales give you an opportunity to buy, for considerably less, the very kinds of commodities for which you now are competing in the open market. Such an opportunity is afforded you in this auction at Camp Dix, N. J., October 17.

Remember the date
OCTOBER
17, 1922

Auction Sale at
Camp Dix,
New Jersey.

A representative list of materials to be offered

Wagons, harness, ventilators, wash troughs, wood working machines, 5-ton electric traveling crane, electric blowers, electric trucks, starting motors, drum hoists (hand and power), screen doors, window slides, sashes, wheelbarrows, hot water tanks (350 to 1100 gals.), ventilating fans, steam crane, stationary boilers (upright and horizontal), portable boilers, electric welder, gas engine, adzes, augers, crow-bars, hammers, shovels, saws, jacks, rakes, pipe cutters, tool chests, trowels, elbows, tees, returns, cross-overs, hand pumps, reducers, plugs, caps, couplings, unions, bibbs, valves, shower heads, electric fans, lanterns and globes, asbestos pipe covering, warehouse trucks, electric motors, marking crayons, hand trucks, lamp guards, reflectors, fuses, cut outs, switches, wagon parts, small hardware, refrigerating apparatus.

The Government reserves the right to reject any or all bids. Catalogs showing all offerings in this auction, offerings well worth the time to investigate, are ready for you now. Write Quartermaster Supply Officer, First Avenue and Fifty-ninth Street, Brooklyn, N. Y.

(Continued from Page 632.)

(four-fifths of a barrel full), and use an average 12 quart pail of this solution to each 100 lbs. sack of plaster, with plain water in the gauging. A little molasses or glue water will aso turn the trick.

Do not confuse dried out mortar with quick set mortar; dried out mortar crumbles between the fingers, whereas quick set mortar feels hard and firm.

You understand, no doubt, that gypsum mortar cannot be re-tempered after it has started to set, and that one gauging should not be mixed with another.

Slow Set

When plaster properly mixed has a tendency to slip from the wall and sag on the ceiling, or to dry out instead of setting, the plaster is apt to be too slow setting. This condition, as in the case of the quick setting plaster, is more than likely to be due to local conditions. One thing that may cause slow set is impure water, such as water that contains sulphur or considerable vetgetable matter.

When plaster is slow setting, it is best to send for accelerator, which is put up in convenient packages, on which are printed full directions. As an immediate expedient, scrape the bottom and sides of the mortar box, or pulverize some set plaster and throw it into the mix. The addition of a little hydrated lime, portland cement, or alum water will also quicken the set. About 2 bs. of alum should be put into forty gallons of water (four-fifths of a barrel full), and a 12 quart pail of this solution used to each 100 pound sack of plaster in the gauging.

It might be said here that none of the ingredients which have been recommended here for slowing or quickening the set of plaster will injure the wall.—*The Plasterer.*

METHODS OF FINANCING THE BUILDING OF HOMES

Different Sources of Obtaining Building Capital Discussed, Showing that the Building and Loan Association is Vital to the Building Industry

BY K. V. HAYMAKER

Sec.-Treas. Detroit Home Builders' Savings and Loan Company

'Tis said that seven Grecian cities dispute the honor of claiming to be the birthplace of Homer. We have about three or four different cities claiming to be the home of the largest building and loan association in America, but the real claimant entitled to the honor has not been named. The biggest building and loan association in America today is the Railroad Men's Building & Loan Association of Indianapolis with between twenty-three and twenty-four million dollars of assets.

This whole conference is based on the fact which we all recognize and all acknowledge, that some efficient practical means must be obtained, must be arrived at, by which we can satisfy the hunger for homes that is felt in every community in America. You realtors all know that you don't get far in any sale of a home until you come to the question, how is this deal going to be financed?

Now, in almost every instance when a man starts out to buy a home, or to build a home, he lacks sufficient money to pay the entire cost. That gap between his available cash and the cost of the property must be bridged by some form of credit, and that credit almost invariably takes the form of a mortgage loan. Hence it becomes a vital necessity for you individually in your business to have an ample, abundant, reliable supply of money ready for investment in mortgage loans. In the last few years there has been a wonderful change in the methods of doing business in all lines. In none of them has there been a greater change than in mortgage loans.

We have had heretofore, four sources from which we secured funds with which to finance mortgages. First, private investments. Under the present income tax law with its heavy income tax and its mounting surcharges, the income from large estates and from men of great wealth, is no longer being invested in mortgage loans.

For example, some years ago, Hetty Green, said to be the wealthiest woman in America, died, and when her son inherited the estate and came to invoice it, he found almost every dollar of it invested in mortgage loans, about fifty million dollars, and when he came to get the returns, he found that after he had paid the income tax with its high surcharges, he was getting less than one per cent. on his money. He at once sold his entire holding of mortgage loans and invested in other securities. That is just one example. Thousands and scores of thousands of wealthy investors who have left the mortgage loan market are no longer buying mortgages.

Then the second are the insurance companies. What is true of the individual investor is largely true of the insurance companies. There are two or three or four perhaps prominent exceptions to that rule, the Metropolitan represented by the first speaker, Mr. Cody, is one which is doing a magnificient work in financing home building loans.

The Equitable of New York has another home purchase plan which is available in many instances. The Prudential of Newark, New Jersey, is another that is investing in mortgage loans in small amounts, in reasonable amounts that help the home builder, but taken in the aggregate the insurance companies of America are curtailing their mortgage investments. Some thirty years ago 58 per cent. of the assets of the life insurance companies of America was under the head of mortgage loans. Today it is less than thirty per cent. of their assets that is invested in that type of security.

The third item, the third source from which money for mortgages was obtained was the commercial banks and the savings banks and trust companies. Today you will find that there are many of them, perhaps a majority of these banks and trust companies, that are not interested in

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.

1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 3519

BLUE PRINTS

mortgage loans. Several causes lead to that. First, these commercial banks and saving banks and trust companies are financing the commercial and the industrial and the transportation business of the country and as this financial depression from which we have been suffering is passing away and as the industry of the country is going to develop and spread and increase, it will take all the resources of all those institutions to finance that business on the short time commercial paper which is so much more profitable than the frozen credits of the mortgage loans, that the banks are not investing in mortgage loans to the extent that they formerly did.

Another most important reason why you will never again see the banking interest of American invest in mortgages in the future as they have in the past grows out of the effect of the Federal Reserve System.

Now the advantage which a bank gets by affiliating with the Federal Reserve System is that it affords a place where they can rediscount their paper, but the paper which they can rediscount in the Federal Reserve Bank must be short time commercial paper. They can't rediscount long time paper. They can't rediscount mortgage paper at all, and for that reason all these institutions, if they affiliate with the Federal Reserve System, will curtail their mortgage investments in order to supply the mort profitable business of financing the short time commercial paper.

Then there is a fourth source from which mortgage loans have been obtained and that is the building and loan system. Unless your attention has been called to it you may not appreciate the magnitude of the building and loan association interests of America. Do you know that there are more building and loan associations in America than there are national banks? Do you know this further fact, that the actual cash paid in to the building and loan associations on their capital stock in America is almost double the combined capital stock of all the national banks in America? They have between two and one-half and three billion dollars of gilt-edged securities in their vaults.

A few months ago Mr. Fiske, the President of the Metropolitan Insurance Company, made a statement at a meeting of the Life Insurance Presidents' Association, as a boast, that in the year 1920 the combined life insurance companies of America made mortgage loans to the extent of $237,000,000. That is a tremendous pile of money. $151,000,000 of that was on farm loans and about $78,000,000 was on city property, and it is a matter of common knowledge that many of the loans made by these insurance companies on city property were on office and apartment buildings and structures of that character which did nothing toward improving the housing conditions in America.

It is a liberal estimate to say that the combined life insurance companies of America in that year did not loan to exceed $50,000,000 on homes in America. Compare that, with what the building and loan associations of America did in that same year when they loaned $550,000,000 in America. So many people have an idea that the building and loan association is a little two by four sort of an institution where children save their pennies, and where the working man saves the dollars and dimes that they can pinch out of their savings. Support and back up the building and loan association in your own home town. If you haven't got one, go out and organize one.

Some years ago I was employed by the National Association of Lumber Manufacturers to travel all over the country. I made a tour of some 15,000 miles from Alban, New York, to Great Falls, Montana, and from Minneapolis and Milwaukee to Dallas, Texas and New Orleans. My message to the lumber dealers of America was that they should get behind the building and loan associations, because every time a building and loan association made a loan in their home town it meant the sale of a bill of lumber, it meant business for them, and as a result of that tour, more than one hundred building organizations were organized in America by the lumber dealers, getting their neighbors around them and organizing an association to build up the community in which they were operating.

Last month they had a big meeting down in Chicago, the American Lumber Congress. A Kansas City man, Mr. James R. Moorehead, read a paper on this subject, and he prefaced his paper by telling this story:

He said, "After I got my paper ready for this convention, just as I was about ready to take the train, I called up my son in Lexington, Missouri, who is running a lumber yard.

"I said, 'Hello, son. What are you doing down there? Any business coming in?'

" 'Yes, nice business this morning.'

" 'What did you do?'

" 'I sold a bill of lumber for a house down here to John Smith. He is going to build over on Elm Street.'

" 'Well, did you get your money?'

" 'Sure, I got the money.'

" 'Where did Smith get the money?'

" 'Out of the Building and Loan.'"

Mr. Moorehead said that he sold that bill of lumber thirty years ago when he organized that building and loan association there, and the story his boy told him over the telephone that morning, has

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls

For Preserving Brick-Stone-Stucco-Concrete

THE TRUSCON LABORATORIES —

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

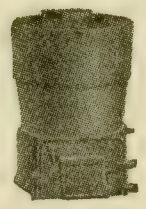
Ice House (alts.), Trenton avenue and Huntingdon street, $10,000. Architect, private plans. Owners, Kensington Hygeia Ice

CONTINUOUS CONCRETE MIXER



What do you think of a machine that will **accurately** measure its own proportions and **thoroughly** mix, at the rate of 27 cubic yards per hour, with a 1½ horse power engine? With the batch mixer, there is a great temptation, in order to increase the output, to slight the mixing. With this machine, such a thing is impossible, because the stuff cannot be gotten out till it comes out of itself; beside, proportions are more accurate.

With the "Batch" method, the measuring is done in wheelbarrows, and no two barrows have exactly the same quantity in them.

We will tell you more about it later.

Reinforced concrete, structural steel and marble, 2 stories, cut stone, cork, tile and linoleum floors, electric light, tile, marble and terrazzo work, hollow metal sash and skylights, bank fixtures, vault doors. Owner taking bids due October 14th at 5 P. M.

Factory, Mt. Etna, Pa. Architect, Calvin Young, 226 North Sixth street, Reading, Pa. Owners, Liebovitz & Sons, care of architect. Frame, 1 story, 27x40 feet, composition roof, pine floors, electric lighting. Architect taking bids due October 12th.

Store and Apartment, Seventh and Cherry streets, Reading, Pa. Architect, M. B. Deckant, 632 Washington street, Reading, Pa. Owner, J. B. Waidelich, American Drug Store, Allentown, Pa. Brick, hollow tile, 4 stories and basement, 97x32 feet, slag roof, hardwood floors, steam heat, electric light, tile work, terra cotta. Architect taking bids due October 16th.

School, Mt. Penn, Reading, Pa. Architect, H. Maurer, 234 North Fifth street, Reading, Pa. Owners, Mt. Penn School Board, W. Edgar Bates, secretary, Mt. Penn, Reading, Pa. Brick, 1 and 2 stories, 38x160 feet, Spanish tile roof, maple floors (heating, plumbing and electric work reserved), hollow tile, roof ventilators, waterproofing, dampproofing. Owners taking revised bids due October 18th.

Stores (2), Glenbrook avenue, Bryn Mawr, Pa. Architect, Michael Capobianco, 778 South Seventh street, Philadelphia. Owner, Frank Peter Paul, care of architect. Tapestry brick, 2 stories, 38x24 feet, slag roof, pine floors, plate glass, hot water heat, electric lighting. Architect is ready for bids.

High School, Sharon (Mercer County), Pa. Architects, Taylor & Hanna, Sharon, Pa. Owners, Board of Education, William H. Whitehead, secretary, Sharon, Pa. Brick, cut stone and steel, 3 stories, 195x171 feet, metal lumber and concrete roof, concrete and maple floors, metal lath, elevators, iron work, floor hardener, bond, hollow metal skylights (heating, plumbing and electric wrok separate bids). Lowest bidder: Sharon Building Co., Sharon, Pa., $399,600.

Pennsylvania Contracts Awarded

Display Room and Garage, Old York road, Jenkintown, Pa. Architect, Andrew C. Borzner, 717 Walnut street, Philadelphia. Owner, T. W. Montague & Co., Inc., Jenkintown, Pa. Brick, cut stone and steel, 2 stories, 36x34 feet, slag roof, composition, pine and cement floors, metal lath, elevators, plate glass, bond, steam heating, electric lighting. Contract awarded to Brown Const. Co., 105 Levering street, Philadelphia.

Home Economics Building, Westtown, Pa. Architect, Walter F. Price, 119 South Fourth street, Philadelphia. Owners, Westtown Boarding School, Westtown, Pa. Brick, 2½ stories, 92¾x28½ feet, slate roof, pine floors, hollow tile, dampproofing, tile and marble, concrete work, copper skylights, electric lighting, vapor vacuum heating. Contract awarded to William H. Jones, West Chester, Pa.

Building, 726-28 Penn street, Reading, Pa. Architect, Fred A. Muhlenberg, 30 Liberty Bank Building, Reading, Pa. Owners, Harold Furniture Co., 812 Penn street, Reading, Pa. Brick, cut stone and steel, 5 stories and basement, 270x40 feet, composition and tile roof, cement floors, demolitioin, roof ventilators, waterproofing, terra cotta, iron work and iron stairs, bond, fire doors, rolled steel sash, terrazzo work, metal lath (heating, electric work, plumbing and electric elevators separate bids). Contract awarded to Robert E. Lamb Co., 843 North Nineteenth street, Philadelphia.

Residences (11), Conshohocken, Pa., $47,000. Architect, Walter K. Durham, 323 Walnut street, Philadelphia. Owners, Lee Tire & Rubber Co., Conshohocken, Pa. Brick, frame and brick, frame and concrete block, 1½, 2 and 2½ stories, 25x25 feet, asphalt slate roof, electric lighting, hot water heating (electric lighting fixtures and gas ranges reserved), pine floors. Contract awarded to Carl F. Hirsch, 462 North Franklin street, Philadelphia.

Garage, 619 North Fifth street, Reading, Pa. Architects, Muhlenberg Brothers, 511 Penn street, Reading, Pa. Owner, J. E. Sullivan, on premises. Brick and stone, 1 story, 31x38 feet, composition roof, concrete floors, hot water heating, electric lighting. Contract awarded to Charles H. Schlegel, 2250 Perkiomen avenue, Reading, Pa.

Factory, Mt. Nebo, Pa. Architect, Calvin Young, 226 North Sixth street, Reading, Pa. Owners, Liebovitz & Sons, care of architect. Frame, 1 story, 27x40 feet, composition roof, pine floors. Contract awarded to D. L. Saylor & Son, Annville, Pa.

Dauphin County Memorial, Elizabethtown, Pa. Architect, Edgar A. Wightman, Heed Building, Philadelphia. Owners, Masonic Home, Elizabethtown, Pa. Stone, cut stone and steel, 3 stories, 102x38 feet, slate roof, cement, maple and composition floors, metal weather strip, iron work, floor hardener, bond, metal lath, marble work. Contract awarded to S. W. Shoemaker & Son, 421 Walnut street, Harrisburg, Pa.

School, North Whitehall Township, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owners, North Whitehall Township School Board, Ironton, Pa. Brick, 2 stories, 12 rooms, slag roof, hardwood floors, hot water heat, electric light, metal lath, tile work, safety treads, roof ventilators, waterproofing and dampproofing. Contract awarded to Butz & Clader, Ainey Building, Allentown, Pa. Heating to American Heating & Vent. Co., 200 North Fifteenth street, Philadelphia. Plumbing to Edwin P. Saeger Co., Allentown, Pa. Electric wiring to A. C. Dullenkopf, Bethlehem, Pa.

New Jersey Construction News

Sales and Service Building, Ninth and Federal streets, Camden, N. J. Architects, Lackey & Hettle, 509 Market street, Camden, N. J. Owners, Neel Cadillac Co., Camden, N. J. Brick, limestone and steel, 4 stories, 64x112 feet, slag roof, cement and wood block floors, metal lath, tile and marble work, rolled steel sash, plate glass. Architects taking bids.

Morris Heights Inn (alts. and add.) to Apartment, Morris Heights, N. J. Architects, William Slack & Sons, St. Regis Theatre Building, Trenton. Owner, John H. Morris, Trenton, N. J. Frame, 3 stories, 20x30 feet, hardwood floors, partitions, tile work, electric light, general interior alterations. Plans in progress.

Residence, Merchantville, N. J. Architect, A. H. Moses, Temple Building, Camden, N. J. Owner, M. C. Bottomley, care of architect. Brick, 2 stories, 38x26 feet, 20x20 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Revised plans in progress.

Residence, Morris Heights, N. J. Architects, William Slack & Son, St. Regis Theatre Building, Trenton. Owner, Mr. Lester Bingley, 211 Perry street, Trenton, N. J. Frame, 2½ stories, 32x30 feet, shingle roof, hardwood floors, electric lighting. Plans in progress.

Residence, Morris Heights, N. J. Architects, William Slack & Son, St. Regis Theatre Building, Trenton. Owner, J. Howard Ronan, 1305 West State street, Trenton, N. J. Frame, 2½ stories, 32x30 feet, shingle roof, hardwood floors, heating undecided, electric light. Plans in progress.

Store, Broadway and Pine streets, Camden, N. J. Architect, Thomas Stephen, Masonic Temple Building, Camden, N. J. Owners, W. L. Hurley & Co., 451 Haddon avenue, Camden, N. J. Brick. Preliminary plans in progress.

Hotel (alts. and add.), Park avenue, Atlantic City, N. J. Architects, Hewitt & Ash, 1827 Arch street, Philadelphia. Owners, Cheltenham Revere Hotel, Mrs. R. W. Richards, on premises. Brick, stone and reinforced concrete, 4 stories, basement, 66x48 feet, slag roof, cement and pine floors, roof ventilators, waterproofing, steam heat, electric light, tile work. Architects taking bids due October 18th by noon.

Store and Apartment, 525 Broadway, Camden, N. J. Architect, Thomas Stephen, Masonic Temple Building, Camden, N. J. Owners, W. L. Hurley & Co., 451 Haddon avenue, Camden, N. J. Brick, 1 story, 20x100 feet, slag roof, pine and terrazzo floors, hot air heat, electric light, marble and terrazzo work, roof ventilators. Architect taking bids due October 19th.

Bank, Audubon, N. J. Architect, Harold Allen, 526 Stevens street, Camden, N. J. Owners, Audubon National Bank, Audubon, N. J. Brick, cut stone, steel and reinforced concrete, 2 stories, 40x66 feet, slag roof, cement, maple floors, metal lath, hot water heat, electric lighting, tile, marble and terrazzo work, bond. Bids due October 18th.

Residence, Trenton, N. J. Architect, William Kleman, First National Bank Building, Trenton, N. J. Owner, Bruce Bedford, Luzerne Rubber Co., Muirheid avenue, Trenton. Brick, 2½ stories, 58x33 feet, slate roof, hardwood floors, vacuum steam heat, electric light, tile work. Architect taking bids due October 12th.

Factory (add.), Beakes and May streets, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, Essex Rubber Co., on premises. Brick, steel, 2 stories, 50x50 feet, slag roof, concrete and maple floors, electric light, waterproofing, fire escapes. Owner is taking sub-bids.

Residence, College street, Trenton, N. J., $9,000. Architect, private plans. Owner, Genarro Lucillo, 65 Anderson street, Trenton, N. J. Brick and shingle, 26x30 feet, slate roof, hardwood and pine floors, electric lighting. Owner will build.

Pumping Station, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, City of Trenton, Commissioner Feel, Trenton, N. J. Concrete, stone, 1 story, 40x80 feet, slate roof, concrete floors. Low bidder: William Hicks, Trenton, N. J.

New Jersey Contracts Awarded

Garage and Stable, Eighth and Market streets, Camden, N. J., $62,000. Architect, private plans. Owners, Supplee-Wills-Jones Co., Twenty-sixth and Oxford streets, Philadelphia. Reinforced concrete and steel, 2 stories, 130x60 feet, slag roof, cement floors, waterproofing, rolled steel sash. Contract awarded to George Kessler Cont. Co., 1733 North Marvine street.

New Hotel Clarion, Kentucky avenue and Beach, Atlantic City, N. J. Architect, William Macy Stanton, 1524 Chestnut street, Philadelphia. Owner, S. K. Boniface, Atlantic City, N. J. Brick, stone and reinforced concrete, 6 stories, 69¾x40¾ feet, shingle, composition and tin roof, cement, tile and oak floors, elevators, hollow tile, terra cotta, ornamental iron work, flush bulks, metal lath, tile work, steam heat (lighting reserved). Contract awarded to Newton W. Knauer, Atlantic City, N. J.

Office and Stores (alts. and add.), 38 East State street, Trenton. Architect, Walter Hankin, 39 East State street, Trenton, N. J. Owners, Fisher Estate, Edward Fisher, care of architect. Steel, semi-fireproof, 4 stories, 19x65 feet, slag roof, pine floors, hot water heat, electric light, hollow tile, metal lath, tile work, rolled steel sash, roof ventilators, waterproofing and dampproofing. Contract awarded to W. C. Ehret, Trenton, N. J.

Miscellaneous Construction News

Office Building, Louisville, Ky. Architect, C. A. Ziegler, 1309 Locust street, Philadelphia. Owner, name withheld. Brick, 3 stories, 24x100 feet. Plans in progress.

Store (int. alts.), Boston, Mass. Architects, McLanahan & Benckert, Bellevue Court Buildin, Philadelphia. Owners, S. B. & G. W. Fleischer, Inc., Twenty-fifth and Reed streets, Philadelphia. Brick, 1 story, 20x160 feet, general interior changes. Plans in progress.

Monastery, Wilmington ,Del., $90,000. Architect, Paul A. Monaghan, 1208 Chestnut street, Philadelphia. Owners, Ursuline Nuns, Wilmington, Del. Brick and steel, 3 stories, 100x60 feet, slate roof, oak koors, electric lighting, tile and marble work, iron work, waterproofing. Contract awarded to Joyce & Kerrigan, 114 North Broome street, Wilmington, Del.

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 2, 1922.—Sealed Proposals will be opened in this office at 3 P. M., October 30, 1922, for alterations, etc., to the United States Post Office, Court House, and Custom House, at Richmond, Va., including alterations to adjoining buildings and approaches. Drawings and specifications may be obtained from the Custodian at Richmond, Va., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., October 5, 1922. Sealed Proposals will be opened in this office at 3 P. M., October 31, 1922, for

counters in Room 423 and Laboratory in the United States Treasury Building, Washington, D. C. Drawings and specifications may be obtained at this office. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 6, 1922. Sealed Proposals will be opened i nthis office at 3 P. M., November 1, 1922, for construction (including mechanical equipment) of a one-story laundry building covering 5,130 square feet, for the United States Veterans' Hospital at the Bronx, New York, N. Y., to be completed within four months from award of contract. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. Proposals will be considered only from individuals, firms, or corporations possessing satisfactory financial and technical ability, equipment, and organization to insure speedy completion of the contract, and who have established a record for expedition on contracts of similar character and magnitude. Before drawings and specifications are forwarded to prospective bidders, applicants must cite at least one specific instance where a record for speed has been established on a job of equivalent magnitude, giving date of award of contract, amount of contract, specified time for completion and date of actual completion. The fact that any concern obtains a set of the plans and specifications from any source whatever and submits a bid shall not constitute a waiver of the foregoing stipulations. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 648)

been repeated in greater or less degree every week, and sometimes a half dozen times a week during this whole thirty years. Mr. Moorhead said that the best stroke of business he ever did was when he organized that building and loan association.

Does that convey any lesson to you realtors? Don't you know that every time a building and loan association makes a loan to a man it increases the value of the property all around you? Perhaps you even get the money with which he buys the lot. Now isn't it up to you to back up these building and loan associations and help to make them popular and help to finance them in the efforts which they are putting forth?

One of the most hopeful signs in our current events is the growing spirit of co-operation and mutual helpfulness which is so rapidly growing up in all lines of business.

The great problem of providing adequate funds for financing the great program of home building with which our country is confronted is of vital importance not only to the public at large but to every line of business which must take part in the work.

Each one of these lines of business is vitally interested in the building association which must be the source from which the funds come to finance all these various steps which convert the wandering, rent-paying tenant into a home-owning, home-loving, patriotic citizen.

(Extract from an address delivered before the National Association of Real Estate Boards during the Conference on Realty Financing held in San Francisco, Cal.)

PRACTICAL POINTERS ON SELECTION AND USE OF HOT AIR FURNACES FOR RESIDENCES

Some Principles of Hygenic Heating Discussed

BY R. B. MONFORT

For the past ten years you have heard a great deal about bacilli, contagion, germs, infection and the need of sanitation. Also you have learned that scientists have made great progress in combating various diseases arising from different sources and that the advancement made along these lines has proven a great benefit to humanity.

Along with the many good things accomplished it would seem, however, that the old adage "An ounce of prevention is worth a pound of cure," should be the ultimate goal, thereby eliminating much unnecessary suffering.

Such a course might not prove practical for all ills, but a very large per cent. of the ailments classified under the head or "bad air diseases" are really preventabe, and their eimination, to a very great extent, woud lessen the mortality in the home. Death by disease is most miserable but the majority of us go that way.

Although winter is supposed to be the recuperating period, the so-called modern methods of living have apparently caused a reversal of nature's plan and these afflictions could rightfully be called "winter diseases." When we shut ourselves in the house with artificial heat, and no serious effort is made to exclude the fire-poisons or provide adequate ventilation, the membranous and nervous disorders become prevalent and often violent.

Real if Not Visible

Unfortunately very few of us pay any attention to the quality of the air in our homes when it is most essential to our very existence. Did you ever stop to think that you could live ten thousand times as long without food and fifteen hundred times as long without water as you can without air? If it is advisable to pay so much attention to the purity of our food and water, it behooves us to pay even greater attention to the purity of the air which we breathe.

Nature performs wonders if her ways are not interfered with too seriously and this article is written with a hope that in some measure we can contribute to better hygenic conditions in the home, during the winter months, more than one-half the year, by showing how to preserve nature's vitalizer—pure air.

Is the Mission to Serve or Destroy?

One of the most dangerous sources of contamination from the heating plant is the escape of the products of combustion through the fire-box into the air circulation. Of these you must realize that carbon-monoxide, an insidious gas, is the most dangerous because its present in the atmosphere even in minutest quantities, acts as a slow poison destroying the "haemoglobin" or half-mature cells in the process of formation. This breaking down of the cells is responsible for many serious nervous disorders, kidney and heart afflictions, and their accompanying disastrous effects.

Should you save the newspaper clippings you would be astounded by the number of families that are entirely wiped out by carbon monoxide poisoning, which only emphasizes that it is the most deadly gas known.

Irregular temperatures are not conducive to good health nor do they add to the comfort of the occupants of the building. They seriously interfere with the natural thermostatic action of our bodies, which is nature's method of protecting us against too sudden changes, consequently play their part in causing colds.

Super-heated air has the same depressing effect as stagnant air, both having the vitalizing principles or energizing properties destroyed. Very few people are able to distinguish between "scorched" or "stale" air and both are recognized as "stuffy" or "dead." Chemical analysis seems to reveal no difference. They both have a decided depressing effect upon our physical stamina.

It is easy to understand why but few people realize to what degree the air in a building becomes contaminated by the occupants, because they have never studied this subject.

The exhalation of carbon dioxide from the lungs, the evaporation from the body, saturate the atmosphere with foul moisture which by lessening our powers of resistance increases our susceptibility to disease. To show that this point is worthy of consideration, the actual secretion of H_2O from the eye, nose and mouth of the average adult in one hour is eight ounces or one common glass full. Add to this the effluvia from our bodies consider the total pollution and you will realize why many homes are "culture medium" for the multiplication of germ life. These facts are called to your notice to impress upon you what the atmosphere in most houses lacks that is essential, and what it contains that is detrimental to your welfare.

Cleanliness for Self Protection

To enjoy the measure of satisfaction, happiness and health, that one should rightfully expect, extra precaution must be taken to prevent the contamination of the air by the heater itself; to prevent the destruction of the energizing properties of the air by overheating and to promptly remove any contamination to the atmosphere by the occupants of the building. In other words build your homes a safe refuge for your customers during the winter, by having the atmosphere as fresh and invigorating as it would be outdoors.

To obtain a heating equipment that will insure necessary hygienic benefits it will naturally require some outlay of money and in order to come within the means of a large per cent. of the intending home owners you will naturally recommend the warm air gravity system. Steam or hot water heating plants combined with a ventilating system are satisfactory in large buildings. In small cottages, however, the cost generally prevents their use.

The FireBox the Critical Element

Steel, which is impervious to penetrating gases, answers admirably for the construction of the fire-box, the different parts should be securely welded, eliminating all rivets and seams so that it is made imperforate, or into one continuous piece of metal. All top surfaces should be eliminated and the radiating surface should be free from all irregularities with ample space between heater and casing to permit an uninterrupted air supply of large volume.

Avoid Scorched Air

That the air may be only mildly heated, never above 150 degrees F. at point of contact with the furnace, large capacities must be specified in both heater and warm air pipes, and a positive automatic control should be utilized, of which the fire-box proper is the principal and actuating member. This not only prevents overheating that devitalizes the air but is a great personal relief from many of the anxieties and uncertainties that seem to be a part of the ordinary heating plant. Not only uniform temperature with but slight attention to the equipment is secured, but it is a protection to the heater and a protection to the home, which gives a great sense of security from unexpected disaster.

Advantages of Rapid Internal Air Movement

The ventilation and heating are so interdependent that they must be embodied in the same system. On this point you must not compromise the health, vitality or personal development of the household.

The air should be completely changed in each room every ten or fifteen minutes and the analysis should be such that at no time will it test more than six parts of carbon dioxide to ten thousand parts of air, which comes within the prescribed limits of the health authorities. To make this possible it is essential that the return capacity to the furnace equal the capacity of all warm air ducts and in addition an outside air pipe be provided of sufficient size to supply twenty-five hundred cubic feet of air per hour, per person, figuring twice as many persons in bed rooms as the average occupancy.

The returns must be scientifically distributed so as to positively prevent annoying and dangerous drafts upon the floor. If the home has an open stairway, a large return face should be located near the bottom to prevent the cooler air from upstairs spreading over the first floor, and the other return faces should be so distributed throughout the living rooms to avoid any disagreeable drafts, even to small children playing upon the floor. The ordinary fire place is usually sufficient for vent purposes.

In addition to the advantages outlined you are assured of a rapid internal circulation that trebles the movement of the air; positive distribution, which makes the heating of windward rooms feasible; the avoidance of great differences in temperature between floor and ceiling and the prompt removal of the vitiated air.

Economy Essential

Items in furnace construction that spell *Economy* in big letters are as follows: Design of fire-box eliminating irregularities with maximum radiations; complete down draft principles; large fuel space with large grate area in proportion, insuring slow combustion and automatic regulation preventing wasteful fires and disastrous over-heats.

Two other things are such important factors that they deserve special mention, not because they come within the province of the building contractor, but because they mean such a saving to the home owner: The depth of the basement, which should be eight feet in the clear if drainage will permit, and the air tight construction of a furnace flue of proper capacity. The greater the depth of the cellar the more elevation to the warm air pipes, consequently the more positive the distribution of heat. Helping to reduce fuel consumption to the minimum with no valuable head room utilized are other valuable features insured. A long article could be written on flue construction but we will pass the subject by saying a leaky chimney often increases fuel consumption over 100 per cent. and decreases heating efficiency over 50 per cent.

Harmony Important for Ideal Results

The heating plant should have right of way over plumbing and electric wiring obstruction and not interfere seriously because the two latter can easily avoid with their efficiency.

The building contractor can assist in many ways by extending his co-operation in the practical location and installation of heating, equipment. This means greater heating efficiency at less cost which gives a greater sense of satisfaction to the home owner, consequently works to the advantage of all concerned.

By planning the heating layout with the building, with the view of obtaining maximum results, the builder will render invaluable service to his client.

The selection of the proper heating apparatus combined with the harmony of forces as suggested will render a great service to humanity and enable many a progressive man to realize his life's ambition of a nice home, which provides comfort, health and happiness for his family. Nature's restorer, pure air should prove his greatest blessing.

The Chimney

Few owners of heating plants realize that the chimney is a vital factor in securing the proper combustion of fuel and the satisfactory distribution of heat. The chimney creates the draft for any kind of heating apparatus. The furnace, in itself, has no appreciable draft—a fact not recognized when the furnace smokes and the house is cold. Far too much worry, inconvenience, and ill feeling have resulted from a lack of knowledge about chimneys on the part of many house owners and some chimney contractors. If the furnace smokes, if the fuel does not burn properly, if the temperature does not register the degree specified in the contract, the heating system, too often is condemned. Then follow complaint, discussions tests, loss of time and loss of money. The conclusion of the whole matter, in a very large percentage of cases, is a poorly constructed flue.

The primary function of a flue is to provide a suitable conduit for the escape of the smoke and gases thrown off by the process of combustion. A necessary physical condition is a small area wherein a uniformly higher temperature can be maintained than that of the outside temperature. The essential object must not be overlooked in chimney building.

Building Age.

The man who doesn't advertise because he can't afford to "do it right" will never reach a position of affluence because everything worth while in the world had to have a beginning, and there can be no "get there" for the fellow who fails to make a start.

As The Editor Sees It

THE pubic mind is so filled with thought of the dire results of strikes and the irretrievable losses resultant therefrom, that a more optimistic view of the situation is interesting and refreshing. Discussing the "Costs of Strikes," *The New York Lumber Trade Journal* says:

Counting the Costs of the Strikes

Now that the whole strike situation is in a manner of speaking clearing up, it is a good time to sum up, take stock and count the cost of it all. A number of our best known economists, not to say statistical sharps, not counting the rest of us, are doing that very thing.

There is a lot of nonsense being talked about it, with too much of mere estimates or fine-spun theory and therefore apt to be misleading. This is as always, and apparently inevitably the case. It is well to remember that we cannot lose something that we have never really had. It is like counting the chickens that never were hatched. So where it runs over into the realm of pure theory, one man's guess is as good as another man's estimate, or maybe more so; and vice versa.

But the lesson has been brought home to all that in the last analysis it has cost the country as a whole—producers, laborers and consumers alike, enough and a plenty and more than they can well afford. Those who have not learned that salutary lesson are dead past all learning. On the other hand, it has been mainly omission rather than commission. It has been a measure of lost productive effort, not comparatively or to any great extent actual destruction of the real material products of human enterprise, energy and effort, such as would result from the ravages of war for instance. So, in the long run, a lot of it will be made up by speeding up till they catch up. For example a given amount of building lumber of all kinds will be sold necessarily until the building program has again caught up to normal, with meantime an equivalent in money made in profits and wages to bring about that result, and sales of lumber to make good accordingly. In other words, when this consummation is at last reached (whenever that may be, the resultant sum total of material wealth produced up to the end of that time will be in substantially equivalent terms as it would have been and with the same total substantial benefits accruing to all just the same as if the strikes had never been. It will take longer, that is all.

So anything like definite detailed statements are apt to prove misleading, as indicated, unless given with limitations and considerable leeway to come and go on. When we remember that what we actually live on has practically to be produced out of the ground each year, it is obvious that real wealth, with due industry, can be produced very fast. In other words, the picture, to give the best idea, needs to be sketched large with the details left much to the individual imagination and experience. Some individuals have lost more than others, notably the strikers in the lack of needed wages; but one of the biggest factors hardest to estimate is the lost motion which leaves for the time being the commercial and industrial machine and individual energies alike inactive to an extent that they begin to grow rusty from disuse. This is a very real loss. But nothing is essentially a loss that it is possible to catch up; in the building program for instance, as cited.

Possibly another worth while acquisition is the mental attitude that inheres in employers and laborers alike at the close of the strike. It is a distinct gain for them if only partially to get it off their chests and out of their systems. One heard it said by many a year ago when the railroad strike was obviated at the last minute after much of the psychological mischief had been done, that the matter had to be settled some time and it would as well or better have been settled right then. The sooner the better. But the immediate expediency of the moment tended then as always to rule the situation; and as to that, at that time the most of us were as guilty as all the rest of us in being willing to temporize and to let it be settled in a way that we knew it wouldn't stay settled. It was like a germ in the system to be got rid of, and

DRAWING MATERIALS

BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 3519

BLUE PRINTS

while even yet it has not definitely and conclusively been eliminated, there is no question that everybody is happier even though nobody got exactly what he wanted and didn't expect.

We do not know how some of the costs of the strikes are arrived at and frankly question some of the statements of actual figures until we do. Some of them look as if they were made to look big on purpose and simply in order to astonish. So much is assumed as a basis that one must consider the conclusions incorrect if one stops to consider them and cannot admit the original assumptions. If in the end it shall turn out that the total loss is one-half or even one-fourth what some of the estimates make it, then it will be indeed stupendous. Anyway let us hope that it will be many a long day before we have another such.

General statements and conclusions are more convincing than any concrete figures. Our indefatigable Secretary of Commerce, Mr. Hoover, takes on the whole perhaps the largest, sanest and most comprehensive view of it that we have seen. Talking in terms that are convincing because of their reserve strength and lack of over statement, he says:

"While the losses to the country due to the two great strikes are considerable, they are easily overestimated. The estimate of current coal miners' wages lost in the five months is not a correct basis because over a period of eighteen months we will probably consume approximately the same amount of coal. In other words, the miners will work more days in the week and produce more coal in the next six or eight months than they would have produced if there had been no strike, and thus the wage roll of the next six or eight months will be larger and will in a considerable degree compensate the loss during this suspension.

"The greatest loss today is the one being met by the farmer as a result of the railway strike. The export of farm products has been seriously interfered with by the inability of the railways to transport produce. Prices are therefore unduly depressed in the agricultural regions and the farmer is suffering grievously.

The inability to transport manufactured products will create some degree of loss, but not so serious as that to agriculture.

"In the broad view, however, if we can get back to business, if we can secure a resumption of transportation and rapid distribution of coal and agricultural produce, we will not have received such an economic wound as cannot be very quickly recovered from. We will probably not be on such a high plane of business prosperity during the next six months as we would have been had the strikes not taken place, but we will undoubtedly be on a much higher and much more comfortable plane than that of last year."

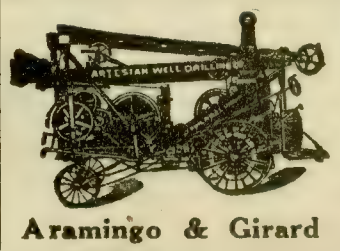
Coming down to the figures of the rail strike, we have seen estimates that put the total losses approximately at one billion dollars in nice round figures as follows: Loss in wages for the period $75,000,000; and by the railroads, $275,000,000 "in various ways," such as "reduced efficiency" of new men, run down equipment, extra strike expenses and damage to property. Then, while admitting there is no positive way of determining the loss, the "estimate" is made that the public has lost twice as much as the roads and the striking shipmen put together. That would be $10 for every man, woman and child in the country. We don't think we have actually lost that much. It doesn't sound reasonable.

INDUSTRIAL SPURT BEGINS AS MANUFACTURERS INCREASE FORCES

Reports to Association Show Industries Preparing for Big Production as Season Begins

Industry is ready for a striking increase in production this fall. This is shown conclusively by reports on the employment outlook received by the National Association of Manufacturers from its members all over the United States.

According to these reports, the great majority of American factories intend to make great increases in their working forces. Extensive increases are planned in the steel, building, lumber and automobile industries especially; and other industries are not far behind.



John E. Edgerton, president of the National Association of Manufacturers, has presented and analyzed these reports in a statement written especially for *The Industrial Digest.* Mr. Edgerton writes:

"Industry throughout this great land of ours will take on a real and definite spurt as soon as the brakes set upon it by the railroad and mine strikes have been completely released. By this I mean not only the return of the men to work, but an open evidence of a realization that the only way in which to put the country back on a real prosperous basis is to stop quarreling and go to work industriously and conscientiously.

"There can be no doubt in the mind of the public and of general business that the last two disruptions have put a check upon industry at the most inopportune time, at a moment when a majority of our active factories and industrial establishments were preparing to make extensions to meet an increased business that was already assured. Statisticians, official and otherwise, tell us of the hundreds

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls — BOOKLET ON REQUEST — *For Preserving Brick, Stone-Stucco-Concrete*

THE TRUSCON LABORATORIES

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

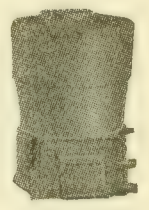
CONTINUOUS CONCRETE MIXER

What do you think of a machine that will **accurately** measure its own proportions **and thoroughly** mix, at the rate of 27 cubic yards per hour, with a 1½ horse power engine? With the batch mixer, there is a great temptation, in order to increase the output, to slight the mixing. With this machine, such a thing is impossible, because the stuff cannot be gotten out till it comes out of itself; beside, proportions are more accurate.

With the "Batch" method, the measuring is done in wheelbarrows, and no two barrows have exactly the same quantity in them.



We will tell you more about it later.

Residence, Haddonfield, N. J. Architects, Lackey & Hettle, 5 Hudson avenue, Camden, N. J. Owner, Dr. S. Ironside, Haddonfield, N. J. Brick, 2 stories, 25x38 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Architects taking bids due October 21st.

Residence (alts. and add.), Somers Point, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City, N. J. Owner, Mrs. R. Craighead, Craig Hall, Atlantic City, N. J. Frame, 2½ stories, 40x160 feet, asbestos shingle roof, hardwood floors, hot water heat, electric light, tile and marble work. Architect taking bids due October 23rd.

Parkway Garage (add.), Boston avenue, Atlantic City, N. J. Architect, Byron H. Edwards, 34 South Seventeenth street, Philadelphia. Owner, Walter Bew, Atlantic City, N. J. Brick, cut stone, reinforced concrete and steel, 1 additional story, 98x130 feet, slag roof raised, cement floors, waterproofing, terra cotta, iron work, bond, electric light, demolition. Architect taking bids due October 20th.

Commercial Building, Gibbsboro, N. J. Architect, A. P. Valentine, 212 High street, Germantown. Owners, John Lucas & Co., Inc., 322 Race street, Philadelphia. Brick and steel, 2 stories, 60x100 feet ,slag roof, cement floors. Owners taking bids due October 21st.

New Jersey Contracts Awarded

Bank Building, Atlantic City, N. J. Architects, McLanahan & Benckert, Bellevue Court Building, Philadelphia. Owners, Equitable Trust Co., Atlantic City, N. J. Brick, granite, limestone and steel, 2 stories and bsement, 48x96 feet, slag roof, cork, maple and cement floors, metal lath, iron work, tile and marble work, rolled steel sash and skylights. Contract awarded to Frank V. Warren, 132 South Seventeenth street, Philadelphia.

Bank Building (alts. and add.), Haddon and Kaighn avenues, Camden, N. J. Architect, private plans. Owners, Parkside Trust Co., on premises. Brick, 1 story, 34x21 feet, slag roof, cement and pine floors, demolition, iron work (heating and finished hardware reserved), electric lighting. Contract awarded to Andrew White, 1139 Sheridan street, Camden, N. J.

Residence, Maple avenue, Trenton, N. J., $6,000. Architect, private plans. Owner, Leslie Harris, 69 Maple avenue, Trenton, N. J. Frame, 2 stories, 24x28 feet, slate roof, pine floors, electric lighting. Contract awarded to W. H. Loose, 308 Logan street, Trenton, N. J.

Apartment, North Providence Terrace, Atlantic City, N. J. Architect, J. H. Vaughn, Guarantee Trust Building, Atlantic City. Owner, George C. Felker, 17 South Kentucky avenue, Atlantic City. Brick, hollow tile, 3 stories, 73x34 feet, slag roof, pine floors, hot water heat, electric light, tile and marble work. Contract awarded to Philip G. Hannum, Atlantic City, N. J.

Residence, West Collingswood, N. J. Architect, A. B. Gill, Law Building, Camden, N. J. Owner, Graham Lucas, care of architect. Frame, 1½ stories, 24x40 feet, asphalt shingle roof, hardwood floors, hot water heat, electric light, tile work. Contract awarded to H. B. Howey, 413 Bailey street, Camden, N. J.

Bank (alts. and add.), Collingswood, N. J. Architects, Lackey & Hettle, 5 Hudson avenue, Camden, N. J. Owners, Collingswood Trust Co., Dr. T. W. Haddon, Collingswood. Office partitions, interior addition, composition floors, electric lighting. Contract awarded to R. A. Scarborough, Collingswood, N. J.

Stores and Apartments, Pacific avenue, Wildwood, N. J. Architect, Mark B. Reeves, Wildwood, N. J. Owner, Louis Staller, Wildwood, N. J. Brick, three stories, 60x80 feet, tin roof, wood floors, hot water heating, electric lighting. Contract awarded to Frank E. Walters, Wildwood, N. J.

Store and Apartments, Pacific avenue, Wildwood, N. J., $16,000. Architect, Mark B. Reeves, Wildwood, N. J. Owner, Walter M. Beers, Wildwood, N. J. Brick, 3 stories, 20x90 feet, slag roof, wood floors, electric lighting (hot water heating reserved). Contract awarded to Bond & Witte, Wildwood, N. J.

Miscellaneous Construction News

Fire House and Stores, Oak Grove, Delaware. Architect, E. L. Rice, 815 Market street, Wilmington, Del. Owners, Elsmere Fire Engine Co., Oak Grove, Del., care of R. W. Crook, Oak Grove, Del. Frame, 2 stories, 25½x64 feet, composition shingle roof, concrete and pine floors, hot water heat, electric light. Owner ready for bids.

Bank and Office (alts.), Twenty-first and Market streets, Wilmington. Architects, Brown & Whiteside, Dupont Building, Wilmington, Del. Owners, Wilmington-Brandywine Bank, care of architects. General interior alterations, hardwood floors, tile and marble work. Contract awarded to Samuel Pierce, Wilmington, Del.

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 6, 1922. Sealed Proposals will be opened i nthis office at 3 P. M., November 1, 1922, for construction (including mechanical equipment) of a one-story laundry building covering 5,130 square feet, for the United States Veterans' Hospital at the Bronx, New York, N. Y., to be completed within four months from award of contract. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. Proposals will be considered only from individuals, firms, or corporations possessing satisfactory financial and technical ability, equipment, and organization to insure speedy completion of the contract, and who have established a record for expedition on contracts of similar character and magnitude. Before drawings and specifications are forwarded to prospective bidders, applicants must cite at least one specific instance where a record for speed has been established on a job of equivalent magnitude, giving date of award of contract, amount of contract, specified time for completion and date of actual completion. The fact that any concern obtains a set of the plans and specifications from any source whatever and submits a bid shall not constitute a waiver of the foregoing stipulations. Jas. A. Wetmore, Acting Supervising Architect.

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."

(Continued from page 664)

of millions of dollars lost by the railroad and mine operators through the shut down; of the hundreds of millions lost to the workers themselves through their selective idleness; but they can give no estimate of the other hundreds of millions of dollars lost to business in general by the economic setback. Had not the country been thrown into these disturbing conflicts, the factories throughout the land would today be in a position tremendously better than they were a year ago; and would be operating at a speed that we have not seen for two or three years.

Now Ready for Increase

"These statements are made advisedly and in view of recent reports received by the National Association of Manufacturers on the employment outlook for the fall and winter. These reports show that *practically every large industrial district in the country was, and undoubtedly still is, planning to make considerable extensions of its forces* in the fall that would put hundreds of thousands of men back to work and add several billions of dollars to the payrolls of the country. The two outstanding strikes not only delayed these extensions, but undoubtedly have made it impossible or impracticable for many of these industries to increase their forces to the full extent they had planned. The processes of reconstruction are much slower than the processes of destruction and it is problematical just how much of a throwback on industry has been occasioned by labor itself.

"Governmental reports show that the production of raw products has more than come back to its own. Our farms have produced more than $1,000,000,000 worth of produce above last year's record; wool production has increased and there are further fine reports on the production of iron. Industrial production would now be keeping up with this magnicent record had we not had the bickerings of the last few months to contend with; but even in spite of these drawbacks, *I am confident that the larger part of our industries will be found to be carrying out their program for extensions almost as fully as they had planned before*, and that our industrial recovery will be speedier than some have thought. The reports we have received on the employment situation show that about six weeks ago practically every basic industry was making arrangements to take on more men at the beginning of the late summer and fall business. The greater part of these extensions naturally were modest and meant probably the additions of 10% to 15% in the crews. But in some particular districts and particular industries, the organizations were preparing to make large additions, while some were preparing to double their forces. There were unusually promising outlooks for the iron and steel industries, building, automobiles, electrical machinery and tools, leather products, lumber products, textiles, paper and metal goods. The miscellaneous industries gave an excellent indication."

The following is a tabular summay of the reports received by the association:

Iron and Steel

	Percentage of reports indicating an increase in working forces
Pennsylvania, Massachusetts and Wisconsin	85
Ohio and New Jersey	80
Indiana, New York, Connecticut, Illinois and Michigan	75
Kentucky, Tennessee, Missouri, Rhode Island and Virginia	100

Machinery and Tools

Maryland, Wisconsin, Delaware and Indiana	100
Connecticut	90
(Some plants will double their forces.)	
New Jersey	85
Illinois	75
Massachusetts Pennsylvania and Rhode Island	65
Tennessee, New York, Missouri, and Iowa	50

Textiles

Massachusetts, New Jersey, Pennsylvania and New York	65
Tennessee, Wisconsin and Indiana	85
Connecticut	50
Rhode Island	45

New Jersey, Tennessee, Rhode Island, Michigan, Wisconsin	85
New York, Massachusetts, Pennsylvania	75
Connecticut, Missouri, Indiana and Iowa	50

Keen Competition Coming

"I believe, with the strikes now in process of settlement, that we have come to the point where we need more than peace in our industrial fabric" Mr. Edgerton continues. "We need peace in our legislative fabric just as well—peace with Congress on our taxation problems, and on our tariff problems. The manufacturers are affected by these questions more than any one other class. Politicians, in their ignorance of the action and reaction of economic law, cannot be expected to treat these matters wisely. If the problems are left to the well-organized management of other interests, the consequences can easily be imagined. The time, therefore, has arrived when the manufacturers must come out from their selfish isolation and through the submerging of their pride and individual opinion, when necessary to united action and through energetic co-operation, solidify themselves into a constructive working force for the solution of the complex and stupendous problems that are in the way of our progress.

"In my opinion, we are entering upon the keenest competition era in all history. The economic advantage which

America now has is offset by certain other advantages possessed by our chief competitor nations. Under the discriminating tutelage of mankind's most efficient schoolmaster, misfortune, our European neighbors have learned lessons in suffering, endurance, patience, work, thrift and economy which equip them in an essential manner for a race to the goal of commercial and industrial supremacy.

"To maintain the lead which we now have in that race, we must not only increase our individual efforts, but must resolve to hold our place by a return to the same spirit of thrift, industry and determination by which our forefathers gave us this magnificient land in which to live."—*From the Industrial Digest.*

OPPONENTS of the *American Plan* contend that the worker is less likely to get a square deal than under "union" regime; that the unions are necessary to obtain fairness.

The following data from the *Architect and Engineer* seems to refute these contentions:

Comparative Wage Conditions in the Building Trades June 1, 1922

Bricklayers—San Francisco, $9.00; Los Angeles, $10.00; Salt Lake, $9.00; Chicago, $8.80; Minneapolis, $8.80; Phila delphia, $7.20; Indianapolis, $9.20, and Pittsburgh, $10.40.

Carpenters—San Francisco, $8.00; Los Angeles, $8.00; Salt Lake, $7.20; Chicago, (open) $8.00; Minneapolis, $6.40; Philadelphia, $10.00; Indianapolis, 7.40, and Pittsburgh, $9.00.

Cement Finishers—San Francisco, $8.00; Los Angeles, $8.00; Salt Lake, $7.00; Chicago, $6.80; Minneapolis, 6.40; Philadelphia, $6.40, Indianapolis, $7.20, and Pittsburgh, $7.00.

Electricians—San Francisco, $8.00; Los Angeles, $8.00; Salt Lake, $7.20; Chicago, $8.80; Minneapolis, $6.40; Philadelphia, $7.20; Indianapolis, $8.00, and Pittsburgh, $9.00.

Lathers—San Francisco, $8.00; Los Angeles, $8.00; Salt Lake, $8.00; Chicago, $8.00; Minneapolis, $6.40; Philadelphia, $7.20; Indianapolis, $9.00, and Pittsburgh, $9.00.

Painters—San Francisco, $8.00; Los Angeles, $7.00; Salt Lake, $7.20; Chicago, $10.00; Minneapolis, $6.40; Philadelphia, $6.40; Indianapolis, $7.20, and Pittsburgh, $8.00.

Plasterers—San Francisco, $10.00; Los Angeles, Ave. 12 10-14; Salt Lake, $9.00; Chicago, (open) $10.00; Minneapolis, $8.00; Philadelphia, Ave. 9 8-10; Indianapolis, $9.00, and Pittsburgh, $9.00.

Plumbers—San Francisco, $9.00; Los Angeles, $9.00; Salt Lake, $8.00; Chicago, $7.00; Minneapolis, $6.40; Philadelphia, $7.20; Indianapolis, $9.00, and Pittsburgh, $9.00.

Sheetmetal Workers—San Francisco, $8.50; Los Angeles, $8.; Salt Lake, $7.20; Chicago, (open) 7.60; Minneapolis, $6.40; Philadelphia, $7.20; Indianapolis, $7.36, and Pittsburgh, $8.00.

Structural Steel—San Francisco, $9.00; Los Angeles, $6.40; Salt Lake, $7.20; Chicago, $8.40; Minneapois, $6.40; Philadelphia, $7.20; Indianapolis, $9.00; and Pittsburgh, $8.00.

Hodcarriers-Bricklayers—San Francisco, $7.00; Los Angeles, $6.00; Salt Lake, 6-7; Chicago, (open) $6.30; Minneapolis, $5.20; Philadelphia, $6.00; Indianapolis, $5.60, and Pittsburgh, (open) $5.60.

Laborers—B. T.—San Francisco, $5.00; Los Angeles, $4.00; Salt Lake, 3-4; Chicago, $5.80; Minneapolis, $4.00; Philadelphia, $3.50; Indianapolis, $2.40; and Pittsburgh, (open) $2.40.

Average Wage—San Francisco, $8.12; Los Angeles, $7.86; Salt Lake, $7.18; Chicago, $7.77; Minneapolis, $6.36; Philadelphia, 7.04; Indianapolis, $7.53, and Pittsburgh, $7.86.

The average wage of the eight representative cities is $7.49.

From the above data, which represents wages paid in the primary building trade crafts in the principal cities of the United States on June 1, 1922, it can be observed that the average wages paid San Francisco building trade mechanics are better than any other city compared. This high wage scale has been guaranteed as a minimum during a year of readjustment, notwithstanding the fact that it was a period of falling prices. Work has been more plentiful, and the building trade mechanic is better off than he has been for many years, as his average annual income is more in actual money and it has more relative buying power. The American Plan is offering no restrictions as to who shall work, as long as he will produce; it is guaranteeing high wages, and the building trade mechanic has more work he can do.

Note—Data from wage scales obtained from the Builders' Exchanges and Employers' Associations of the various cities. "Open" means average wage paid craft. No agreed wage scale.

When you stop to consider that the Guide **reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.**

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

As The Editor Sees It

THE dearth of skilled mechanics has been a great handicap to the Building Industry during the past year or more. The difficulty of obtaining sufficient apprentices for the various trades has been set forth and discussed in the GUIDE at various times. Of course the contractor, the material dealer and those most intimately associated with building, feel most keenly and quickly the insufficient supply of skilled labor. However, as the *American Contractor* sees it, apprenticeship is a public problem, for says that paper:

Chamber of commerce should be particularly interested in helping put through a program for the training of apprentices. The one and only ultimately proper agency to supervise this training is the state or perhaps the municipality. Surely through public institutions is found the proper channel for the training of youth. If contractors spend money in maintaining an apprentice school, it is casting bread upon the waters with a good chance for none of the good results being washed back to the donors. The apprentice is not a peon and upon completing his program to his or to others' satisfaction, he is quite likely to accept employment elsewhere than where he received his training. Further, there is a strong prejudice hard to overcome that when a group of association of employers trains apprentices it is doing so with the intent of "busting unions." The best way to keep unionism strong is to keep right on giving the impression that force or policy is being used to break them down. There is nothing so conducive to solidarity as outside opposition.

The continuation school is not unknown in the United States, but it is too little known and too little made use of. We have a public system of education. The point is to make this system cater to present needs. This means that some boys should be trained for the useful and honorable profession of bricklaying. The contractor can do his bit to bring a continuation school to his city. He can do his bit through his association for effective state laws on the subject of such schools. But the contractor can not do all the work and spend all the money. The material dealers and producers must aid the contractor in securing apprentices, else their market dwindles. Civic bodies such as chambers of commerce should be aroused to the point of keen interest in this critical problem.

OUR ACHIEVEMENTS

The United States—The World's Chief Burner

To what shall we attribute our vast increase of national fire waste? Surely not to a lack of knowledge of the construction of fireproof buildings; architects, contractors, building men everywhere are advocating and explaining the nature and uses of building materials and methods which tend to check the inroads of the red demon, Fire. Shall we state that the American people are indifferent to their enormous fire losses, or, shall we put it that we are gamblers, willing to take a chance that our buildings will escape? Indeed, one is almost led to believe that the latter holds true, for the average man, when broached upon the possibilities of his home catching fire, makes light of it.

But, question that same American citizen upon the possibilities of saving his family in case the seemingly incredible should happen that his home would be burned to the ground. You will find that "he hadn't thought of that!" Also observe his attitude toward a man who knowingly builds a structure so susceptible to flames that but a spark is required to make it a vast bonfire, and then forces his wife and children to live in it! Criminal carelessness is a disagreeable name for such an action, but what would a person call it—thoughtlessness?

The law recognizes no such term when dealing with its offenders. We send our children to schools that must be of fireproof construction, our wives to resorts where the hotels are built under the supervision of fire inspectors; yet require them to live in a home that would disgracefully fail under the tests of the fire inspectors.

BLUE PRINTS

The European Situation as Viewed by Benjamin Franklin

It appears that even as early as the day of Benjamin Franklin, the methods of European fire-restraint construction were noteworthy, for that eminent philosopher and shrewd observer, in writing from London to a friend in America, had the following to say:

"It appears to me of great importance to build our dwelling houses, if we can, in a manner more secure from danger by fire. We scarcely ever hear of fire in Paris. When I was there, I took particular notice of the construction of their houses and I did not see one of them that could well be burned. The roofs are of slate or tile, the walls are of stone, the walls generally lined with stucco or plaster instead of wainscot. The floors are of stucco or of those square tiles burned brown, or of flagstone or of marble. The stairs, too, at Paris are either stone or brick with only a wooden edge or corner for the step, so that on the whole, though the Parisians commonly burn wood in their chimneys, a more dangerous kind of fuel than that used here, yet their houses escape etxremely well, as there is little in a room that can be consumed by fire except the furniture, whereas in London, perhaps scarcely a year passes in which half a million of property and many lives are not lost by this destructive element. Of late, indeed, they begin here to leave off wainscoting their rooms, and instead of it cover the walls with stucco, often formed into panels like wainscot, which, being painted, is very strong and warm. Stone staircases, too, with iron rails, grow more and more into fashion here."

The people of Europe, due to the influence of an older civilization, are naturally more cautious and saving. In a land where fortunes are not easily made and where each generation tries to add its mite to the savings of the past, it is readily understandable that a man contemplating the erection of a home, does everything in his power to safeguard his slowly acquired fortune.

Another fact of great significance. The law in the majority of the European countries deals stringently with owners of buildings wherein a fire originates. Through a well organized and efficient system of fire marshals, each fire is strictly investigated and the guilty parties punished for their part in it, even though it be through negligence or ignorance.

Would You Report a Murder?

When one realizes that the majority of the fires caused in the United States are preventable, it would seem that the American people are guilty of countenancing criminal negligence. We raise our hands in righteous indignation against the thief, the footpad and the burglar; we shudder when reading of the outrageous action of the depraved murderer of women or children. What then should be our attitude toward the man who lightly scoffs at fire and fails to use a modicum of care in defense of that fieend, Fire—the greatest murderer and pillager of our country?

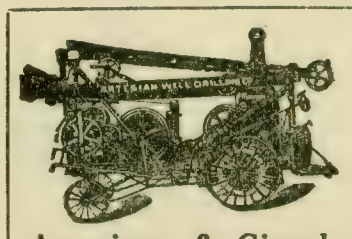
More Thought Must Be Given to Fire-Retardant Construction

Let us discuss the phase of constructing our buildings so that they may be as fireproof as possible. Of course, in modern building there is no construction that is absolutely fireproof, and when we speak of a building as being such, we mean that it will retard the progress of flames for a certain length of time and is not conducive to a general conflagration.

To these buildings should be added the terms "death proof" and "conflagration proof."

Fire must be destroyed in its incipiency and buildings should be so constructed that a fire will be confined to the place of its origin until the arrival of the fire department. Means of safety, both to persons and property, must be assured by making impossible the instant conversion of elevator shafts and stairways into flues for the flames, and by making impossible the rapid spread of flames from room to room and floor to floor.

Although the great fires of this country have occurred, for the most part, in places of manufacture, theatres and large public buildings of one kind or another, nevertheless the majority of all the fires and a very large portion of the fire losses belong to the dwelling house.



Who Is to Blame?

There is a fundamental mistake which has been the cause of much loss and suffering in this country, and which arises from a wrong idea as to the construction of the small house. If we estimated the number of buildings in the United States as twelve million, it is safe to say that of this number probably eleven millions have been built in entire disregard of the combustible nature and arrangement of their materials.

Because plaster is noninflammable, the average man presumes that it is an effective retardant to fire and there his reasoning stops. But, suppose a spark lodges in back of that plaster which is only natural—for when the heat dries out the plaster, it falls from its base—what will then happen? In the majority of structures, where metal lath and fire stops have not been used, the walls are nothing but a series of connected flues whose chief function in the event of fire is to quickly conduct the flames to every part of the

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls

For Preserving Brick, Stone-Stucco-Concrete

THE TRUSCON LABORATORIES —

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

School, Cinnaminson, N. J., $46,198. Architect, J. Fletcher Street, 129 South Fifth street, Philadelphia. Owners, Board of Education, Township of Cinnaminson, Burlington County, N. J. Brick and steel, 2 stories, 85x50 feet, slag roof, cement and maple floors, metal lath, tile work, hollow metal sash, bond, iron work. Contract awarded to George W. Shaner & Son, Palmyra, N. J.

Apartment House, Oakland and Atlantic avenues, Atlantic City, N. J., $75,000. Architect, Bertram C. Ireland, Guarantee Trust Building, Atlantic City, N. J. Owner, Harry Weinmann, Atlantic City. Brick, steel, concrete, cut stone, terra cotta, 3 stories. Contract awarded to Lam Building Co., 1001 Wood street, Philadelphia.

Factory, Mt. Vernon and Mt. Ephraim avenue, Camden, N. J., $30,000. Architect, Emil Bullock, 34 South Seventeenth street, Philadelphia. Owners, Camden Pottery Co., Camden, N. J. Brick and steel, 2 stories, 70x140 feet, slag roof, cement floors (heating, electric work and elevators reserved), rolled steel sash, iron work. Contract awarded to E. R. Hall, 34 South Seventeenth street, Philadelphia.

Store, 525 Broadway, Camden, N. J., $19,300. Architect, Thomas Stephen, Temple Building, Camden, N. J. Owners, W. L. Hurley Co., 451 Haddon avenue, Camden, N. J. Brick, 1 story, 20x100 feet, slag roof, pine and terrazzo floors, hot air heat, electric light, marble and terrazzo work, roof ventilators. Contract awarded to James W. Draper, 436 Haddon avenue, Camden, N. J.

Building (alts.), 312 Cooper street, Camden, N. J., $10,000. Architect, private plans. Owners, U. S. Veterans, Arlington Building, Washington, D. C., care of Sub-District Manager, District No. 2, 23-25 Broadway, Camden, N. J. Carpentry, mill work, pine floors, painting, wire fences, hardware, heating repairs, electric lighting, plumbing. Contract awarded to J. M. Yardley, 1716 Sansom street, Philadelphia.

Pumping Station, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, City of Trenton, Commissioner Feel, Trenton Water Works, Trenton, N. J. Concrete, stone, 1 story, 40x80 feet, slate roof, concrete floors, electric lighting. Contract awarded to William Hicks, Trenton, N. J.

Store and Apartment, Greenwood street, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owner, Philip Morgan, 1200 Greenwood street, Trenton, N. J. Frame, 2 stories, 35x75 feet, shingle roof, pine floors (heating and plumbing reserved), electric light, tile work. Contract awarded to Watkins & Griffith, Trenton, N. J.

Miscellaneous Construction News

War Memorial Building, Baltimore, Md. Architect, Laurence H. Fowler, 347 North Charles street, Baltimore, Md. Owners, City of Baltimore and State of Maryland, Baltimore, Md. Brick, granite, cut stone, steel and concrete, 1 story, basement and gallery, 186x100 feet, slag roof, concrete linoleum and plank floors, metal lath, waterproofing and dampproofing, iron work, bond, hollow metal doors and sash, tile and marble work. Architect taking bids due October 31st at 3 P. M.

High School, Baltimore, Md. Architect, Josias Pennington, 330 North Charles street, Baltimore, Md. Owners, North Eastern Junior High School, Board of Education, Baltimore, Md. Reinforced concrete, brick, limestone, granite and steel, 3 stories and basement, 151x130 feet, (2) wings, 74x159 feet, slag roof, composition, concrete and pine floors, metal lath, elevators, metal weather strip, waterproofing and dampproofing, terra cotta, iron work and stairs, bond, floor hardener, kalamein doors, rolled steel sash and skylights, tile and marble work, steam heating, electric work. Lowest bidders: J. Henry Miller, Baltimore, Md., $997,000; Charles L. Stockhausen, Baltimore, Md., $998,447.

Oil House, Tool Check Room and Crew Rest Room and Engine House, Hagerstown, Md. Architect, William H. Cookman, Broad Street Station, Philadelphia. Owners, Pennsylvania Railroad Company, Broad Street Station, Philadelphia. Brick and steel, 1 story, 30x15 feet, 36x35 feet and 120x136 feet, slag roof, reinforced concrete and pine floors, rolled steel sash, rolling steel doors (plumbing, heating and lighting reserved), iron work. Contract awarded to John P. Pettyjohn & Co., Lynchburg, Va.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., October 23, 1922.—Sealed Proposals will be opened in this office at 3 P. M., November 20, 1922, for roof over extended mailing platform, etc., United States Post Office, Toledo, Ohio. Drawings and specification may be obtained from the Custodian at the building, or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 680)

house. It is the duty of every man who has it in his power to sway the judgment of the prospective home builder to explain a method of building into his home, protection not only from fire to his family but protection to his neighbors from a conflagration.

Architect, Contractor, Engineer, Owner —All Must Work Together

It behooves us, as a humane and intelligent people, to call a halt to this national waste. Instead of casually remarking upon the size of the annual fire waste when it is quoted in dollars and cents, rather we should visualize the misery of those who have seen the savings of a lifetime go up in smoke or the indescribable anguish of those who have had their beloved ones perish in a horrible flaming death. This depiction of the annual fire report coupled with the realization that Fire is a Brother of the Grim Reaper who strikes without warning, should cause us to pause and ask ourselves: "Am I trying to prevent the visitation of this destroyer to my home?"

COLOR AND TEXTURAL EFFECTS IN STUCCO

Opportunity for Originating in Beautifying House Exteriors

BY EDWIN K. BORCHARD, in *The House Beautiful*

Every lover of beautiful houses has a vivid mental image of each of the few houses which have superlatively pleased; or it may be that he has visualized a "dream house" which is a composite ideal of the best and most perfect details of many houses. And yet, when we see or think of a beautiful house, how often do we analyze our impressions to determine just what it is that excites our admiration? Probably very rarely—and indeed, often it is wiser not to look too closely lest we find some flaws in our perfect gem.

It is safe to say that the architectural treatment of the house, the balancing of proportions, detail and ornamentation contribute a large part to the effect a house makes upon the observer, as do also the surroundings of landscaping and planting. But closely allied to these, in adding to, or detracting from, the appearance, are the colors and textures of the walls. We often see an otherwise passable house made absolutely hopeless by the antagonistic or too-brilliant shades of a poorly chosen color scheme. Picture the most charming country house of the clean white New England cottage type that you have ever seen, in its setting of green lawns—and then try to imagin it painted a barn red or a chocolate brown! An exaggerated example of course, yet it illustrates in a *reductio ad absurdum* how important a part color plays in the appearance of any house.

Properly handled, stucco affords a wide range of colors and yet, because of certain limitations, it does not allow any great errors to be made in choosing the colors. An almost infinite number of shades are available, but because these shades are all soft and subdued they combine well with almost any architecture or setting. Unless a deliberate effort is made to secure brilliant or decided colors, any of the lighter-toned stuccos of today will yield pleasing colors.

To deal specifically with color combinations or to recommend particular shades for one type or another of house is as impossible as specifying or giving advice on the color of a gown or scarf—it really is a field where individuality must have free play. However, there are certain broad general rules to which it is advisable to adhere, though of course like all rules they may be broken.

First of all, a smooth, pure white finish is not advisable for any city or even semi-suburban location where the air is smoke-laden and carries soot and dust to discolor the walls. White is possibly the oftenest chosen color—hence many will not agree to this dictum. It is better, however, frankly to recognize this limitation which is common to all white surfaces, whether of paint, stucco or marble. A pure white stucco wall may be scrubbed or acid-washed to restore the original whiteness, but it is best to avoid this necessity. This does not mean that we must fall back upon a dark gray stucco or some similar smoke-colored shade. On the contrary, we need only substitute for pure white, a delicate cream or warm buff-tone which any *reasonable* amount of smoke will only mellow without being so glaringly apparent as on a white surface.

In the suburban or country house blessed with pure air and the proper green setting, the white stucco house is at its best. The delightful contrast between white and green, each serving to accentuate the beauties of the other, forms a perfect picture which easily explains the popularity of white houses. The fact that the whiteness is not a matter of a surface coating but is *in* the wall and hence permanent, in itself is an attractive feature of stucco.

So that an intelligent selection may be made of color combinations and effects in stucco, it is helpful for the owner to have some knowledge of the technique of obtaining the desired effects. Color in stucco is obtained in two ways: by the natural method and by the artificial. As might be expected, the former method is preferable in almost all cases.

The term "natural" is used because the color is imparted by naturally colored sand, pebbles or stone chips in conjunction with white Portland cement. Some years ago the regular gray cement was used for stucco, but with the advent of white cement, color in stucco was made possible because the background of white permitted the color tones of sand or stone to be exhibited in their full value. For this reason the effects obtained carry a feeling of freedom from artificiality and a natural variegation that is only possible when Nature contributes the color from her own palette.

Pure white is the simplest of all and merely requires a clean white sand or crushed marble and white cement. Equally simple are the creams, buffs and light browns, for these may be imparted by an ordinary yellow or brownish sand, often available from nearby sources and at a remarkably low cost. Many an owner who has set his heart upon white stucco and found white sand not easily obtainable, has been delightfully surprised by the splendid tone resulting from the use of an ordinary yellow sand. The delicate cream or warm buff resulting has just sufficient color to give the effect of that subtle toning so often contributed by Time.

Reds, pinks, green and yellows are obtained by the use of stone chips or pebbles of the color sought for, either by a layer of the chips cast-on and pressed into the stucco or else mixed in integrally with the stucco. Pink granite or feldspar chips and yellow pebbles may be employed, or red, yellow and green marble chips utilized—even a mixture of several colors is often desirable for securing a natural variegation and tone-blending.

In the securing of color by natural methods the tones are all subdued and easily adapted for harmonizing with the surroundings. Where a striking, pronounced and more vivid tone is desirable, resort is made to coloring by means of powdered mineral pigment mixed with the stucco.

It is safe to say that the most interesting recent development in the art of beautifying house walls is the use of textural effects in stucco. Like many other artistic treatments, it is a deliberate revival of the older and cruder workmanship of bygone days, when our modern machine-like precision and perfection was not possible. Probably texture as applied to stucco and plastered surfaces originated with the half-timbered type of English country house.

At first, no doubt, the rough marks of trowel and float were due to lack of care or the limitation of tools and materials. When the charming effects resulting began to be appreciated, the treatment became more delibrate, free-hand and informal—fitted for harmonizing with the rugged simplicity of the half-timbered country house. It has, today, developed into a means of decorating wall surfaces at low cost and with no sacrifice of lasting quality or integrity of the wall material.

Wall surfaces of large unbroken area need some type of textural treatment as

an aid to architectural ornamentation in avoiding monotony of appearance. This need of texture is recognized in other materials than stucco, as is evidenced by present-day use of rough textured brick, or by rough, uncoursed stone walls. Probably with stucco the charm of texture is explained also by the liking we all have for any piece of work that shows the craftsman's labor. A piece of hand-carved furniture, though perhaps not so sure and perfect in its execution, receives our attention, where one machine-sawed does not attract us even by its mechanical perfections. So a stucco surface showing the marks of trowel and float interests us, while a smooth finish is the usual and uninteresting.

Textural finishes must be used cautiously and with judgment in order to avoid effects merely bizarre or unusual. The surroundings and setting of a house, as well as its architectural style, determine the textural treatment that will be most appropriate. For example, a city house limited in size of lot, should be finished with one of the more usual surfaces, while a country house may be given practically any texture, with the bolder and more informal ones favored. Again, the distance between roadway and house is an important factor: the greater the distance the rougher may be the texture. In other words, an extremely rough surface that is beautiful at a distance might by the courseness of its details lose some of its attraction when viewed from a roadway twenty or thirty feet away.

Certain standard textural finishes are the ones best adapted to the average house placed on a moderate size suburban lot, and also where expense is a consideration. Such finishes are known as sand floated, spatter dash, pebble dash and stippled. All can be applied by the ordinary skillful workman without undue cost. A stippled texture is one of the best for giving a moderate roughness suited to most houses and locations. It has also the advantage of being almost "*foolproof*"—that is, its appearance is almost sure to be pleasing even under the hand of a mediocre workman. In a locality where the very best labor is not obtainable, such a finish is extremely useful.

The underlying motif of all the more unusual texture finishes, is the frank exhibition of the technique of application. The mark of trowel and float is not concealed, but is even accenuated to produce the proper impression. It might be likened to the bold brush-strokes of the painter in oils, who not only does not seek to conceal, but sometimes emphasizes the light and shadow by a lavish use of his pigments. So the strokes of the plasterer's tools are manipulated to give an interesting surface to stucco—to impart character to plain wall areas and to produce that air of informality so desirable in the country house.

At first glance, these finishes look simple of execution because of their seeming lack of careful workmanship, but in reality they require great skill in application. One of the unexpected features is the difficulty of persuading the plasterer to forget his love of true, smooth surfaces and to deliberately produce what to him appears a poor job. In fact it is a wise precaution to use a small portion of wall in an out-of-the-way part of the house for experimental purposes. The workman then applies, in the presence of the owner, say six square feet of the chosen texture. If it does not meet with approval it is at once scraped off before it has hardened and the effort repeated until a satisfactory finish is secured. This acts as a comparison sample for the whole of the house. In judging texture, it is essential to do so at a sufficient distance to allow proper perspective.

A finish of great possibilities and one much used is one which results from allowing the trowel or float, drawn in a semicircular direction, to form slight ridges in the stucco, these ridges overlapping or rather joining each other at various angles. This gives a moderately smooth surface broken up by the circular float making. Especially under oblique light, these markings are thrown into relief and by the contrast of bright lights and shadows impart an effect extremely attractive. This finish forms a splendid background for vines and gives a texture sufficiently rough to afford good support for them.

A rougher and more unstudied finish than the one just described is obtained by depositing with the float mortar in haphazard masses and without any effort toward continuity of surface or level. Practically no limit exists as to the variations possible with this finish. In one the impress of the float is more or less patterned and regular; in another the irregularity is so marked as to give almost the effect of an unfinished surface. This type of texture must be employed with great care to avoid an eccentric or bizarre finish.

New textures may be originated almost at will because of the plastic nature of stucco. One unusual finish consisted of long irregular scorings in the surface—another a roughened surface partly flattened and smoothed with a trowel. On one very unusual house near New York City, the stucco finish is said to have been applied with bare hands, and exhibited the marks of hands and fingers. Surely this is reverting to old methods of construction and might be said to have revived the finishes used in the wattle and daub huts that were the forerunners of our present-day highly perfected and modernized stucco houses.

BETTER HOMES WEEK

Better Homes Week naturally suggests the advantage of having permanent crack-proof and fire resistive walls and ceilings in order to prevent unsightly plaster cracks which are a continual source of upkeep expense for interior decoration, and at the same time to insure a satisfactory degree of fire protection. Properly reinforced by metal lath, plaster will present a beautiful uncracked surface and will stop fire. To insure having the advantages of this form of construction, every plastering specification for residences in which wood lath predominates should call for metal lath over the heating plant and fuel storage and on the bathroom wainscot.

The attractive appearance of the prominent rooms in the home is a constant source of pride to the owner. This is assured by the use of a substantial plaster base, such as metal lath, on the ceilings, of the living room, dining room, entry hall, and under the stairs and stairwell where exposed to view from the main floor. Corner cracks are also eliminated in large measure, by the use of a 12 inch reinforcing strip of metal lath bent into the corners and applied over the ordinary wood lath where walls and ceilings intersect. For the better houses, in addition to the above, metal lath should be used on the walls of the prominent rooms, and over the entire ceiling of the basement.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

Many a man would do a better job if he didn't know about putty.—Ex.

As The Editor Sees It

THE question of apprentices looms large on the horizon of the building industry. Skilled workmen are far too few to meet the demands of the present day building program, and in many cases, contractors have paid any price to get men to complete a job. Very often, in this day of money worship, a young man can think only of earning money quickly and will fail to realize the greater earning power which will eventually result from a thorough apprenticeship.

There is a lot of argument, says *The Clay Worker,* and mixed in with it an unnecessary amount of dissension on the subject of apprentices, trade schools, and how a young man is to acquire the necessary training in any skilled calling to qualify him as a skilled worker.

There is argument back and forth between official publications of employers' organizations and other official publications of unions of employes about the apprentice question. One side claiming that the unions are inclined to limit and restrict the number and thus put stumbling blocks in the way of progress especially in building trades. Some of the union papers on the other hand find flaws in the quick and intensive methods devised in connection with vocational schools for training skilled workers, and so the argument goes on without limit and without that kind of real enlightenment which we need at the present time. There is too much confusion and confuting argument and not enough effort apparent to point a clear and progressive way for the training of youngsters in whatever calling they may choose.

The average youngster of today hasn't the patient persistence of a generation or two ago. He does not like the idea of spending two or three years as an apprentice. Some say, too, that employers for the most part do not find it profitable to employ apprentices. The real answer here probably is that the employers do not find it profitable to employ an apprentice in the capacity and at the wages paid for the qualified skilled workman.

In most all trades and callings where a skilled man is required, there is usually also required the assistance of helpers. With the proper spirit of co-operation the skilled man can teach the helper the things he knows so that in the course of time the helper acquires real practical knowledge along with his experience that will qualify him without the long term of apprenticeship which used to be considered necessary.

There is a disposition to mingle with vocational training certain academic studies. We have on the one hand vocational training or manual training mixed in as a part of our schools. On the other there is a reaching out into industry and striving for a combination by means of which students can attend school so much and put in so much time at actual work under real industrial conditions and thus get a combination of schooling and training that will be good and will advance them more rapidly.

There is a third angle to this problem made up of introducing specific schooling and instructions as a part of industrial training along with the regular employment in industries of magnitude sufficient to make practical organized group effort of this kind. So we are really making some progress, and out of the various efforts and experiments we should get light and knowledge that will lead us to better things if we can just eliminate factional differences and that narrow selfishness which prevents a man seeing good in those things which he does not feel moved to advocate himself. In the training of youngsters as in the manufacturing itself progress is the order of the day and we should be able to shorten the time and increase the efficiency of our efforts by proper study and experiment and that is what we will get to eventually. And the sooner we stop bickering and show a more earnest effort all around for the general well being of humanity and the progress of industry the sooner we will attain a more satisfactory state of affairs in the training and qualifying of youngsters for skilled callings.

CO-ORDINATING THE BUILDING TRADE

If the situation in the building trades of Philadelphia and its immediate vicinity is to be made easer, to the furthering of the interests of the city and the public and the advancement of building, both residences and business places, there must be co-ordination in the building trades, says H. J. Baringer, secretary of the Philadelphia Building Congress.

"This co-operation," says Mr. Baringer, "must be effected by men representing every one of the many and highly diversified trades, professions and activities which enter into all building operations, if it is to be made thoroughly efficient. Their main purpose must be an intensive study of economy in the building industry.

Idea Is Country-Wide

"This idea is by no means new. Organizations similar to ours already exist in New York, Boston and Seattle, where much has been accomplished. Our organization has attracted attention from other cities, and we have received requests for information as to our procedure from such large cities as Chicago, Detroit, Cleveland, Pittsburgh and others.

"The fundamental idea is to place the building industries on the highest possible plane of integrity and efficiency and to correlate all the efforts toward betterment now being made by single groups in these industries.

"All the component parts of these industries in Philadelphia and vicinity are being urged to participate. It is purely a conference association which handles its work through committees and is dedicated to the improvement of the service which these industries can give to the community.

"These component parts or groups are twelve in number, and are in conformance with the same groups as classified by the American Construction Council, of which Franklin D. Roosevelt is president. They are architects, engineers, general contractors, sub-constractors, construction labor, material and equipment manufacturers, material and equipment dealers, financial, surety, accounting, insurance, building and loan and real estate organizations. Besides these, there are also representatives of the great commercial organizations, such as the Chamber of Commerce and the Board of Trade, the public utility construction departments, representatives of the Federal, State, county and municipal bureaus and departments concerned with the construction associations of builders, the employers and the public.

Much Construction Under Way

"With approximately $100,000,000 worth of building construction under contract so far this year, and with the scarcity of craftsmen in nearly all lines and the present bidding for skilled help which is going on, it is easily seen that the building congress movement must appeal to those interested in the stabilization and betterment of these industries.

"The sole object of the local movement is to enable the building industries to promote the general welfare by discovering, through scientific surveys, the needs of the public and of the industry; by finding and recommending means of satisfying those needs; by defining group functions and harmonizing group activities through the formulation of codes of ethics and of practice; and by any other means agreeable to and in the interests of the public and the industry and conformable to law.

"It will be noticed that the rights of the public play an important part in the objects which the congress has set out to achieve. We believe that the day has passed when the public cannot be considered. It is the public that ultimately pays the bills for all such work and which occupies the buildings which are constructed, and it has a leading place in any deliberations as to ways and means concerning a thing in which it is so vitally interested as in the work of the building trades.

"The local congress now boasts a membership of about thirty representatives of the various trades involved in the movement, each of whom is actively interested in the work and who at present represent as individuals, all the component factors mentioned.

"The Executive Committee of the organization is now at work on a preliminary study of all available data concerning every phase of the several industries which go to make up the building trades, from the number of employes, accidents and deaths, the rate-and-man hour required in all the building crafts, up to and including the building requirements of every type of construction from a wagon shed to a modern office building.

"This material will later be analyzed by a special committee, which will coordinate and correlate all the data into one large picture of the facts and the requirements which confront the industry.

Building Codes Vary

"Take, for example, the variation in the building codes of various cities. In the matter of the erection of grandstands alone there is a divergence of from 20 to 120 pounds; that is, the requirements in one city will call for a stand which must be built to carry 120 pounds more than the requirements of another city. This leads to waste and added cost in construction, for it is apparent that there is no necessity for a stand to be built

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls

For Preserving Brick-Stone-Stucco-Concrete

THE TRUSCON LABORATORIES —

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

Priory, American Mechanics' Bank Building, Trenton, N. J.

(Continued from page 696)

which shall carry 120 pounds greater strain than another city requires, the latter being well above the safety point.

"There is no doubt that there is enormous waste in building construction industries, but these can only be definitely ascertained after a scientific investigation such as we are making. This waste is not confined to any one group, but runs clear through the various industries.

"Another thing which must be carefully aprpoached and scientifically determined is the matter of apprentices for these trades and of vocational guidance, and, in this, we shall be assisted by the Board of Education, the Franklin Institute, the Y. M. C. A. and the various employers and employes' associations. In this manner we hope that the building trades and crafts may be made more attractive to young men, and that it will be able to afford them the fullest means, first, of education, and later, of employment for efficient workers. These crafts must be constantly recruited if the community is to be efficiently served.

"But the primary object is to better working conditions, to make for a better understanding of the men with the materials with which they work; for more co-operative feeling among the various groups, and absolute fairness to every one who is engaged in or who comes into active contact with the groups of industry. If this can be accomplished, it will be a long step in the right direction, not only for the workers and the employers, but for the public as well."

A bulletin of the Building Trades Employers' Association of Cleveland has an interesting story by Otto Best who says:

"Past experience in vocational training has proven that apprentices manifest greater interest in a trade school when there are features employed to increase its attractiveness. It is the idea of the Apprentice Committee to appoint an Examining Board which, in conjunction with the Board of Education, will submit to the boys at stated intervals an examination in the theory and practice of bricklaying. If the apprentice passes this examination with a satisfactory mark he will receive a bonus in the form of increased wages or a reduction in the term of his apprenticeship. At the present time no definite conclusion has been reached as to which form will be used."

The committee passes on applications for apprenticeship studies, the qualities and progress and also makes a survey and takes into consideration the number of youngsters that the trade will absorb in a given community so as to maintain as near as possible the proper balance between supply and demand.

Efforts are made also to obtain complete co-operation of both employers and of local unions and to develop apprenticeship ideas on a modern and progressive basis.

WHY AN ARCHITECT?

An architect does more than build a house. He provides a setting for a personality. He interprets the occupants in terms of their dwelling. He puts four walls and a roof around the atmosphere of a family. Every client is an individual study. The architect sells not only experience and skill; primarily he sells service. He looks after the physical details of building; his roofs do not leak, his paints do not peel, his chimneys do not smoke. He also studies the habits and characteristics of his client, and seeks above all to provide a home in which the owner will be comfortable, happy, satisfied. Beyond the technical side of his profession he will aim to produce those intangible values that make all the difference between a family barracks and a home in which a family will abide content.

To attain this result the architect draws on his expert acquaintance with building problems in all their multiplicity. Technical skill and artistic gifts combine to make the architect, and it would be strange indeed if a man possessing these qualities could not save his client from many mistakes of judgment and many unwise expenditures. He draws plans, prepares specifications, obtains bids, writes contracts, supervises construction, makes sure the owner gets what he pays for. When the completed building is "delivered" the owner may know that his materials are "right," his house well designed, his workmanship "sound." About one owner in three assumes the architect has no interest in the site, that the dimensions of the lot and the owner's limit of cost are all he cares to know. On the contrary, the architect studies the site. Often he has topographical survey made with foot contours. He helps the owner place the building on the lot with reference to the views it may command, its distance from the street, the opportunity for lawn and gardens. He advises as to the style of architecture that fits the location and the suitability of the materials to be used, whether brick, stone or timber. He suggests the arrangement of rooms in terms of the site, so that vulnerable points will not be exposed to freezing blasts and living rooms will not be shut away from sunlight and outlook, so

that the approach will be effective and the general arrangement convenient. Then the architect is ready for his rough preliminary drawings. After these have been studied he will make the final and complete drawings, the working plans and specifications.

Four times in five the owner tells the architect what he wants, and how much he will spend, and the architect replies that the two are not compatible. Whenever the owner fixes an absolute ultimate of expenditure the architect has no option but to help his client to scale his building accordingly. Here two facts usually emerge: that a small house is more difficult to design than a large one, if it is not to be merely commonplace, and that an able architect can do remarkable things in the way of elimination and yet keep the essentials. Moreover, experience brings prescience so that the architect will help the owner to avoid those after-thought "extras" and those expensive deviations from the original plans that always run fast into money. He will try to locate every fixture and foresee every detail so that his first plans will direct all operations to the driving of the last nail.

Without an architect the owner is in the hands of his builder or contractor. Doubtless the average contractor means to be honest, but without supervision he is exposed to temptation and it is to his advantage to skimp. Unless the owner is an expert and has time to devote to supervision the builder may use materials below specifications and "get away with it." Are there pitchy knots in the lath? They mean yellow spots in the plaster after awhile. Punky framing lumber with many edges is not strong enough. Such terms as "shift" and "slash" mean nothing to the tyro, but if the wrong material is used the floors will splinter up. An owner once noticed that his specifications called "only" for "extra" shingles and added "No. 1." Therefore he roofed his house not with the best shingles, but with the worst. Shingles are graded down from "extra," or knotless; to "clear," with no knots in their exposed portions, and "extra No. 1," with knots anywhere. Clapboarding is "clear" or "extra;" which should be used? Flooring is "clear," "factory," and "No. 2;" which shall you choose? How shall you select your interior finish from the scores that will be urged on your attention? One famous building firm will employ only three crews of plasterers, men who are sure to build "for keeps," whose work will not be "all out" in ten years. Asbestos shingles may be laid in a half-dozen ways producing as many effects and corresponding differences in cost. A certain architect wrought patiently and tactfully to convince his well-meaning but deluded client that a house should have no clapboarding, but block siding; the owner since has expressed his gratitude. An architect will avoid vexing delays. The plumbing and the heating may be in process of installation and the electricians at work before the carpenters finish. Competent supervision means both that the tradesmen shall be punctually on the premises and that the several crews shall not get into each other's way.

As the building business is organized today the contractor and the owner are bound by a standard form of agreement which provides that the contractor shall follow the architect's plans and fulfill the General Conditions of the contract. These General Conditions also are cast in the standard form of the American Institute of Architects. There are some forty-five articles in all, covering all manner of contingencies, defining carefully the rights and duties of all the parties, and treating of documents, drawings, claims, insurance, payments, liens, sub-contracts, corrections, and a hundred other topics. Contractors usually make estimates or submit competitive bids, and here again the owner may well accept the advice of his architect. For estimates vary greatly. Often the highest is really the cheapest. One bidder is accurate and careful; another merely takes a chance with no genuine knowledge back of his proposals; a third may be a shyster who intends to parcel out the job among a score of subcontractors from each of whom he will exact a profit. Many large contractors today maintain extensive organizations and are well educated and efficient men. But they can hardly be expected to take such an individual interest as does the architect who first conceives the plan, then sketches his vision, and finally watches its development in terms of wood and stone.

The architect almost invariably saves his client the full amount of his fee. He avoids waste of space, time, and materials, and all three mean money. He is not merely a superior sort of watchman, yet he makes sure that what is done is well done. Work well done is permanent, vastly reducing the cost of upkeep.

Choose your architect with care. Then trust him. When he tells you that plain things live and gewgaws do not survive believe him. When your views differ be willing to "be shown." Remember he is trained to apply skilled intelligence to achieve results that fit your needs.

—*House Beautiful.*

CAN BUILDINGS BE MADE FIREPROOF?

BY CLARENCE W. NOBLE, ASSOCIATE MEMBER, AM. SOC. C. E.

A lexicographer would have a difficult time to define the word "fireproof," giving it the meaning with which it is used by the average man. Should he ask what it means when applied to a building he would doubtless receive the reply that it means a building which will not burn. Were we to ask if it would apply to an office buiding having a steel frame, tile floors, tile partitions and terra cotta tile outside walls the reply would doubtless be the affirmative. The inquirer, however, might find out that the Burlington Building in Chicago was such a structure, and that when this building was gutted by fire the partitions were largely destroyed because they expanded and crushed themselves against the ceiling, and that the soffits of the tile floors were destroyed by being spalled off by the heat. Mr. Average Man, with his poorly-defined ideas, might, in reply to this, shift his definition of fireproof construction to a reinforced concrete structure, but against this could be cited the case of the Edison fire, in which the heat was so intense that the sides of reinforced concrete beams built with a limestone aggregate, melted, and were found after the fire hanging from the bottoms of the beams like icicles. Mr. Average Man, if he continued argumentative might then point out that the contents of a blast furnace at a certain portion of its height are normally made up largely of melted limestone, and that as the blast furnace runs continually day and night it must necessarily be fireproof. To this the inquirer would naturally reply that all blast furnaces have to be shut down at frequent intervals for relining, and with this reply it is to be hoped that the conception of a perfectly fireproof structure would be driven out of Mr. Average Man's head.

Actually there is no such thing as a "fireproof" structure. The word implies perfect ability to resist the attack of fire, and perfection is something that is not obtainable by human beings. The word should be replaced by the word "fire-resistive," and discussion of the subject should always include the idea that the degree of resistance which is necessary is fixed by the probable intensity of the fire which is to be resisted.

It is the gradual realization of the fact that the so-called "fireproof" building is an unattainable ideal that has discouraged the attempt to develop better fire-resistive construction for ordinary structures. In Europe where the prevailing type of building follows a precedent which was laid down in the Middle Ages, the per capita fire loss is but a small fraction of that of the United States. This is in spite of the fact that the so-called "fireproof" types of structures were developed in this country, and that their ordinary construction looks antiquated to us. The reason is that they have inherited a type of building construction which, for ordinary size building, is reasonably fire-

resistive against the degree of fire that is apt to occur in a building of that size. The lesson is obvious. We, in this country, have long been accustomed to paying no attention whatever to the fire-resistive features of ordinary buildings. If the importance of the building were not sufficient to justify an expenditure necessary to build it in steel and terra cotta, or in reinforced concrete construction, we have designed it as though it would sooner or later fall a prey to the flames anyway and we might as well make it as cheap as possible in consequence. If our architects, for the last fifty years, had given one-tenth as much study to the development of adequately fire-resistive construction for ordinary size buildings as they have done to the so-called "fireproof" construction for monumental buildings, fire losses, and consequently our insurance cost, would be at the most not over one-fifth of what it now is.

It is not necessary that an isolated building of ordinary size should be built entirely of incombustible material in order to be reasonably fire-resistive. It takes two to make a quarrel. It takes two elements to make a fire—fuel and air. If free air can be kept away from the wooden framework of a house it is reasonably safe against an ordinary fire.

Herringbone Lath and Plaster will do it. The air passages between joists and studs should be carefully firestopped with bulkheads made with Herringbone Lath and Plaster or made with Herringbone Lath Baskets which are filled with concrete. Wood laths, which warp as soon as the fire strikes them, thus throwing off their plaster protection and admitting the flames to the wood framework, should be omitted in all instances, and Herringbone Lath put in their place. Outside walls of cement stucco on Herringbone Lath (back-plastered construction) are now definitely cheaper than outside walls of clapboards with paint.

An ordinary residence, made adequately fire-resistive by the use of Metal Lath, can be contracted for at so closely the price of an ordinary combustible structure that the architect when opening his bids would not be able to judge from the quotations alone whether or not the fire-resistive features were included or omitted by the contractor. It is very reasonable to assume that the low bidder out of a group of four or five bids could add the fire-resistive features to his quotation and still remain under the high quotation. It is an assured fact that a residence thus treated is as adequately able to resist any fire to which it could be exposed as is a modern so-called "fireproof" office building able to resist the greater conflagrations to which it may be exposed.

The day of the fire-resistive ordinary building is now here. Such buildings can be made reasonably safe against fire by precautions so inexpensive when compared to the values that are protected, that a prospective builder does himself an injustice if he does not use them. So, too, the architect or contractor, when building for his client, owes it to his client to tell him of the relative cost of inflammable and fire-resistive construction and let him decide for himself the choice between risk and safety.

PROPERTIES OF A GOOD WOOD PRESERVATIVE

A list of the various substances that have been used or suggested for preserving timber from decay would include a surprisingly large proportion of those known to industrial chemistry. By-products for which no use could be found have often taken their last stand as possible preservatives of wood. There have been sent to the U. S. Forest Products Laboratory for testing of their preservative qualities the condensed fumes of smelters, the waste liquors of pulp plants, the refuse of tanneries, the skimmed milk of creameries, and a wide assortment of compounds under trade names.

Very few materials have been found to have value as wood preservatives. Most of them lack one or more of the following requirements.

To preserve wood against decay a substance must first of all be poisonous to wood-destroying fungi. Decay in wood is not due to direct chemical action or action of the elements but is always the result of the activity of these plants which feed on the wood and thus destroy it. To prevent fungous infection, the preservative must be able to penetrate the wood thoroughly enough ot form a continuous exterior shell of poisonous treated wood deeper than any surface checks which are likely to develop, and to retain its toxicity, or poisoning power, under service conditions.

Safety in handling and use is another important consideration. A wood preservative must not be a dangerous poison to men and animals, a highly inflammable substance, nor a material injurious to wood. If it seriously corrodes iron, steel, or brass its use is limited because of its action on the treating equipment and on bolts and metal fastenings in contact with the wood in service. Color, odor, and effect on paint are sometimes of considerable importance.

Provided a preservative meets these requirements its cost, availability, and uniformity will largely determine its usefulness.

There are materials of established protective value now on the market which are both cheap and plentiful. The standard wood preservatives in the United States are zinc chloride and coal-tar creosote. Their value has been established by many years' use of millions of railroad ties, poles, posts, paving blocks, mine timbers, and other wood treated with them. Search for new and better preservatives is constantly being made, but in the meantime the wood preserving industry has at its command these reliable materials.

Thomas F. Gibson has severed his connection with the Western Waterproofing Company of St. Louis, Mo., to take charge of the General Chemical Company's HARD-N-TYTE Engineering Service.

The HARD-N-TYTE Engineering Service is devoted exclusively to contract work for hardening, weatherproofing and wearproofing cement floors, roads and other cement construction; dampproofing and waterproofing; building sub-structures, tunnels, reservoirs, vats, etc.

Mr. Gibson will be located in the Franklin Trust Building, Philadelphia.

Charles J. Mitchell, architect, has opened a new suite of offices at 15 South Twenty-first street, Philadelphia. Through an error Mr. Mitchell's address was given as 21 South Fifteenth street in the "Builders' Guide" of October 18th. His telephone is Spruce 8389.

Frank V. Nickels, architect, formerly of 225 South Sydenham street, is now located at 15 S. 21st street, Philadelphia. His telephone number is Locust 4715.

Arnold Mueller, architect, lormerly of 1727 Bristol Street, has opened new offices at 901 Walnut street, Philadelphia.

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

As The Editor Sees It

CONTRACTORS and material men have been trying, for some time, to eliminate the seasonal character from the construction industry. In view of the scarcity of skilled mechanics and the great need for building, the call to remove this seasonal stigma is more insistent than ever. The problem has been successfully solved in so many instances that building in winter is no longer a hazardous undertaking, and certainly is the only answer to the question of speeding up work, keeping costs down and men employed. People are beginning to realize the advantages of building after the rush of the summer months is over and many more are flocking to the building bargain counter this fall than at any time since the war halted home construction. Contractors and architects, usually the first to feel the approach of cold weather with a slump in business, report a steadily increased volume of inquiries and city officials are writing more permits for erection of homes.

Men in the building industry, from material manufacturer to carpenter and mason, have long known the economic advantages of building in the "slack season." For several years the industry has waged a steady campaign to bring this fact before the public and spread the congested activity of a few months over the entire year.

When the greater portion of building is crowded into seven months, prices reach their highest in the spring and summer when the demand crowds supply. The same situation obtains in the labor phase of the work.

By building in the fall and as far as possible into the winter, this demand is more nearly proportioned among 12 months of the year; mills and factories are able to maintain a steadier flow of production; raw material is stabilized; workmen are not shifting jobs so often, and the contractor and architect are able to keep their basic organizations intact, thus decreasing overhead expenses and assuring more satisfactory and efficient work.

Men in the industry see in this autumn's increased building, the prospect of a broadening of the old short season and a consequent stabilization of building costs, estimating that the certain success of the home owners who are building this winter will prompt many others to take the step in succeeding seasons.

The manufacturers of cement particularly have waged stedy campaigns on this one subject, in perfecting methods of using their product in cold weather to the best advantage and to bring a realization of the savings to be effected before the public.

That such campaigns have borne fruit is evidenced in reports for proposed construction from many cities which show a greater volume of all classes of building on the books for fall and winter than ever before.

Says the *American Contractor*:

Chair warming tactics will be in the discard throughout the construction industry this winter, according to all indications. September building permits for the country were not very far below the total of those for August. Reports from architects' offices indicate that they are still busy transforming the hazy ideas of builders into blue-printed plans. Everywhere contractors are figuring bids on work to be done during the snow storms.

Winter building is not new. For more than ten years winter construction has been successfully carried on by leading contractors. They have successfully demonstrated that though icicles gather around a job, progress can still be made. The contractor unacquainted with winter work must remember just one thing: He must be prepared.

The basic principles of winter construction have been evolved. Technical details may be gleaned from a number of sources. It is the particular layout of each job that will call for ingenuity in the contractor's office.

The layout of the job equipment has always been a decisive factor in efficiency and the securing of a profit. In winter construction it becomes much more important because there must be more care in the handling of materials. They must be heated and covered, and

BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 3519

BLUE PRINTS

mixed with warm water for concreting. Handling processes, therefore, run into money unless the equipment is laid out to do the work efficiently.

A dozen technical factors are involved which must be considered in the light of the best engineering practice, or the contractor is likely to make a business error. Contractors should be glad of a chance to go ahead with winter building, but they will have worse troubles than frost-bitten hands unless they plan and carefully prepare to handle the winter work. They must figure that the job will cost more, and then try to make it cost less.

In the opinion of *Keith's Magazine*: If the cold months must be cut from the building season, this makes building one of the most "seasonal" of the big industries, when in reality only a few of these lines are at all dependent on the season, except as people all flock to the paperhanger or the painter at a preconceived time. It is only the exterior shell of the building that is under dominion of the weather. When a buiding is once enclosed, winter is an even better time than summer to do the work. This seasonal nature of the work adds excessively and unnecessarily to the costs, in the industry.

Under proper conditions all kinds of building can be satisfactorily done at any season, however. Old builders tell tales of the difficulty found in tearing down buildings which they remember, or records show were built during winters memorable as unusually cold seasons. One builder recalls the brick walls of a warehouse in a Canadian city, being taken down with very great difficulty, which had been built during a particularly hard winter when the bricks were laid with the temperature hovering in the neighborhood of 30 degrees below zero.

The great bulk of the work done by general contractors, it is stated, is accomplished between May and October, inclusive, a period of six months. If this time is extended to include April and November, it still leaves a slack period, which is very expensive to the industry, for it is an obvious fact that the time thus lost must be paid for by the public. A more equitable distribution of work through the year would operate toward more satisfactory conditions for every one concerned. It is the annual income which must supply a living wage, and every day of enforced idleness increases the wages which are required for the days of work. It is the intermittent work, where regular wages can not be expected at the end of the week or month which makes much of our seething unrest.

Economic Advantages

While most people prefer to begin building in the spring, there are advantages in starting the job early enough in the fall that the masonry work can be done before cold weather begins, and special protection is necessary; thus getting the building enclosed so that the workmen can complete it without hurry or worry during the cold season, when there is generally nothing rushing the work and it can be properly done.

HIGH FUEL COSTS DEMAND BETTER BUILDINGS

When fuel was cheap and plentiful, it was but natural that buildings should be erected with little regard to their efficiency for heat conservation. In recent years much time and study have been devoted to perfecting the various types of heating plants and pipe coverings in order to deliver the maximum amount of heat possible from the fuel used to the space to be heated. Why not, then, a little scientific consideration of how to minimize the loss of this heat from the building? Remember the heating plant merely replaces the heat lost, and the fuel consumed is directly dependent upon the frequncy of this replacement.

Heat losses occur (not considering ventilation) through infiltration of air, transmission through glass and transmission through walls and roof. Just as proper weather stripping will largely overcome infiltiation and storm sash greatly reduce the transmission through windows, modern insulating materials applied to walls, roof or other exposed areas of a building will surprisingly reduce heat losses through these surfaces.

The necessity for reducing these losses should not be underestimated nor the local climate given too much credit. In this latter respect it is interesting to note that a committee appointed to study fuel conservation during the war, reported that the cost of heating houses of similar size was practically the same in Texas as in Minnesota. This is an excellent illustration of how climatic advantage can be offset through improper construction. Along this same line, one of the largest installers of industrial heating plants makes the following statement:

" . . We had a case recently where a manufacturer had decided upon a certain type of roof. In his mind a roof was a roof. It had nothing to do with heating. As a matter of fact, we were able to show the manufacturer how the excessive heat losses through the roof he had selected would cost him several thousand dollars a year in coal bills over certain other types of roof. In reality he had made his room a huge radiator to warm the great out-of-doors. And he was paying for the coal out of his profits! A study of heat losses precedes the calculation of radiating surfaces in the

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

Theatre and Office Building, Northwest Corner Broad and Locust streets, Philadelphia, $2,000,000. Architects, Hoffman-Henon, Inc., Finance Building, Philadelphia. Owners, Stanley Company of America, Jules E. Mastbaum, president, 1218 Market street, Philadelphia. Stone, brick, steel, concrete and terra cotta. Architects selected. Too early for details.

Building, 1312-14 Chestnut street, Philadelphia. Architect, Andrew J. Sauer Co., Denckla Building, Philadelphia. Owners, Cunningham Piano Co., Eleventh and Chestnut streets. Brick, steel, concrete, cut stone and terra cotta, 15 stories, reinforced concrete and hardwood floors, tile, marble and terrazzo, elevators, plate glass, electric lighting, steam heating. Plans in progress.

Residences (14), Fifty-fourth and Overbrook avenue, Philadelphia. Architect, private plans. Owner, Benjamin Herman, 522 South Sixtieth street, Philadelphia. Stone, brick and stucco, 2½ stories, slate roof, electric lighting, hardwood floors, tile and marble work. Plans in progress.

Catholic High School Building, Forty-ninth and Chestnut streets, Philadelphia. Architects, Hoffman-Henon, Inc., Finance Building, Philadelphia. Owners, Archdiocese of Philadelphia, Nineteenth and Race streets, Philadelphia. Stone, brick, steel and concrete. Sketches being prepared. Too early for details.

Ice Cream Plant (7 or 8 buildings), Forty-third, South of Woodland avenue, $500,000. Architect, William F. Koelle, Twenty-sixth and Oxford streets, Philadelphia. Owners, Breyer Ice Cream Co., Ninth and Cumberland streets, Philadelphia. Brick, steel and concrete, (1) 4-story building and 1-story buildings, ice storage, boiler room, engine room, stable, garage, cabinet room and manufacturing building. Preliminary plans in progress.

Residence, City Line near Sixty-sixth street, Overbrook, Philadelphia. Architect, William Koelle, Twenty-sixth and Oxford streets, Philadelphia. Owner, William F. Koelle, Twenty-sixth and Oxford streets, Philadelphia. Stone, 2½ stories, size of lot 100x150 feet. Work contemplated.

Factory Building, Tioga and Janney streets, Philadelphia. Architect, H. Rex Stackhouse, 129 South Fifth street, Philadelphia. Owners, Cold Blast Feather Co., 169 West Berks street, Philadelphia. Brick, 2 stories, size of lot 100x353 feet. Plans in progress. Too early for details.

Service Station, Walnut street, between Thirty-sixth and Thirty-seventh streets, Philadelphia. Archiects, Hoffman-Henon, Inc., Finance Building, Philadelphia. Owners, W. Edwin Blair, 5945 Chestnut street, and William J. Meenehan, Sixty-second and Walnut streets, Philadelphia. Hollow tile, brick and stucco, 1 story, 100x120 feet, slag roof, cement floors, steam heat, electric lighting, plate glass. Plans in progress. Architects will take general bids in two weeks.

Community Garage, Store and Apartments, Kensington avenue and Boudinot street, Philadelphia. Architect, private plans. Owner, Alan Laro, 234 South Fifty-first street, Philadelphia. Brick and stone, 2 stories, irregular size, slag roof, cement and hardwood and pine floors, metal lath, plate glass, metal bulks, tile work, steam heating, electric lighting, demolition. Plans in progress. Owner will be ready for bids in two weeks.

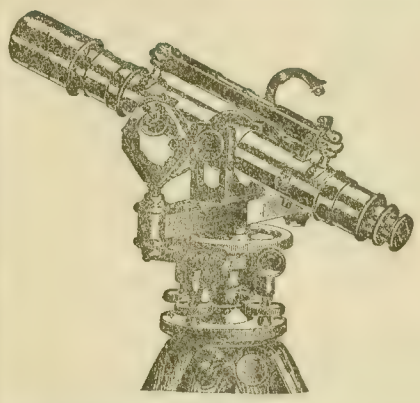
Residence (alts. and add.), 2005 North Sixteenth street, Philadelphiai. Architect, J. Ethan Fieldstein, Otis Building, Philadelphia. Owner, Joseph Ginsberg, care of architect. Brick and steel, 3 stories, 35x30 feet, hot water heating, electric lighting, tile work, hollow metal skylights, iron work, plastering, painting, glazing, carpentry, mill work. Ready for bids in a few days.

Residences (28), Fifty-fourth and Montgomery avenue, Philadelphia. Architect, Karl F. Otto, 3 North Nineteenth street, Philadelphia. Owner, Joseph Feldman, Lincoln Building, Philadelphia. Brick, 2 stories, 16x42 feet, slag, tin and slate roof, mineral and hardwood floors, electric lighting, tile work, cement work, garages in basement. Plans in progress. Architect will take sub-bids.

Residence and Garage, Oak road, Queen Lane Manor, Philadelphia. Architect, Karl F. Otto, 3 North Nineteenth street, Philadelphia. Owner, Henry Goldthorp, 338 Seymour street, Philadelphia. Stone, 3 stories, 42x28 feet, wing 14x16 feet, shingle roof, hardwood floors, hot water heat, electric lighting, tile and marble work (3 baths), cement work. Architect will be ready for general bids in one week.

Residences (48), Fifty-fourth and Morse street, Philadelphia. Architect, Karl F. Otto, 3 North Nineteenth street, Philadelphia. Owners, Kenin & Shapiro, 5850 Market street, Philadelphia. Brick, 2 stories, 16x39 feet, slag, tile and slate roof, hardwood floors, hot water heating, electric lighting, tile work. Owners will take sub-bids in one week.

Residences (8), Lincoln Drive, Philadelphia. Architect, John J. Carroll, 34 South Seventeenth street, Philadelphia. Owner, Samuel Golder, care of architect. Stone, 2 stories, 26x50 feet, slate roof, oak and pine floors, hot water heating, electric lighting, tile and iron work. Architect taking sub-bids due as soon as possible.



Bank (alts. and add.), Seventh and Dauphin streets, Philadelphia. Architect, Paul A. Davis, 3rd, 1713 Sansom street, Philadelphia. Owners, Northern National Bank, William H. Bellew, chairman of Building Committee, on premises. Brick and terra cotta, 2 stories and basement, 50x70 feet, slag roof, tile and marble work. Plans in progress. Architect will take bids in one month.

Store (alts. and add.), 5724 Chestnut street, Philadelphia. Architect, J. Ethan Fieldstein, Otis Building, Philadelphia. Owner, Thomas J. O'Neill, 5724 Chester avenue, Philadelphia. Brick and steel, 2 stories, 16x20 feet, slag roof, pine floors, hot water heating, electric lighting, tile work, iron work. Ready for bids in a few days.

Store Building (alts. and add.), 3335 Walnut street, Philadelphia. Architect, Jesse M. Stetler, 1462 North Fifty-second street, Philadelphia. Owners, Tomoyian Co., 111 South Fifteenth street, Philadelphia. Brick, 1 story, 30x20 feet, concrete slag roof, pine floors, electric work, metal bars, plate glass. Owner will take bids.

Residence (alts.) (basement store), Fifty-fifth and Media avenue. Architect, Jesse M. Stetler, 1482 North Fifty-second street, Philadelphia. Owner, H. S. Miller, 1484 North Fifty-second street, Philadelphia. Excavation, reinforcing beams, stone work, cement work, metal bars, plate glass, electrical work. Owner will take bids in two weeks.

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls — *For Preserving Brick-Stone-Stucco-Concrete*

THE TRUSCON LABORATORIES —

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

and lighting extensions. Owner will build.

South High School, Junior-Senior Annex, Pittsburgh, Pa. Architect, Edward Stotz, Pittsburgh, Pa. Owners, Board of Education, Pittsburgh, Pa. Brick, concrete and steel, 3 stories and basement, and sub-basement, 160x135 feet, composition roof, maple, cement and composition and cork floors, metal lath, waterproofing, iron work and stairs, hollow metal sash, tile, marble and terrazzo work (heating, electric work and plumbing separate bids). Lowest bidder: P. H. Kelly Const. Co., 1713 Sansom street, Philadelphia, $469,900.

Residence, Rydal, Pa. Architects, Tilden & Register, 1525 Locust street, Philadelphia. Owner, Mrs. C. E. Doan, Rydal, Pa. Stone, 2½ stories, 35x80 feet, slate roof, hardwood and pine floors, vapor heating, electric lighting, tile and marble work. Architects are ready for bids due November 17th.

Residence and Garage, Penlyn, Pa. Architect, John Meigs, 1211 Walnut street, Philadelphia. Owner, Hutchison Scott, care of architect. Architect taking bids due November 9th.

Garage and Show Room, Souderton, Pa. Architect, Jerome S. Landes, Souderton, Pa. Owner, J. J. Gillman, 1336 Girard avenue, Philadelphia. Brick, 1 story, 42x135 feet, slag roof, plate glass, cement and pine floors, electric lighting. Preliminary plans in progress. Will take bids in spring of 1923.

Church (alts. and add.), Tamaqua, Pa. Architect, G. C. Freeman, Sixth and Court streets, Reading, Pa. Owners, St. Jerome's Roman Catholic Church, Rev. H. Baker, Tamaqua, Pa. Stone, 1 story and basement, 20x60 feet, hardwood and cork floor, electric light, tile work, terrazzo work, plastering, stained glass. Plans in progress.

Hall Building (alts. and add.), Conshohocken, Pa. Architect, United Eng. Co., 323 Walnut street, Philadelphia. Owners, Knights of Columbus, Conshohocken, Pa. Brick work, cement work, structural steel and iron work, plastering, oak and composition floors, metal lath, plastering, painting, glazing, iron work (heating, lighting and plumbing separate bids). Architects taking new bids due November 13th.

Pennsylvania Contracts Awarded

Residence, Penfield, Pa. Architect, Walter K. Durham, 323 Walnut street, Philadelphia. Owner, D. F. O'Hara, 4045 Green street, Philadelphia. Stone, 2½ stories, 26x38 feet, garage, 1 story, 20x24 feet, shingle roof, hardwood and cement floors, hot water heating, electric lighting, tile work. Contract awarded to Suburban Const. Co., Penfield, Pa.

Residence, Penfield, Pa. Architect, Walter K. Durham, 323 Walnut street, Philadelphia. Owner, F. H. Barras, 4045 Green street, Philadelphia. Frame and stucco, 2½ stories, 25x33 feet, shingle roof, hardwood floors, pine floors, hot water heating, electric lighting, tile work. Contract awarded to Suburban Const. Co., Penfield, Pa.

Residence and Garage, Spring City, Pa. Architect, J. Vincent Poley, 162 Second avenue, Royersford, Pa. Owner, Norman I. Gruber, 334 Yost avenue, Spring City, Pa. Tapestry brick and stone, 2 stories, 38x30 feet, tile roof, oak and pine floors, pipeless heating (heating, plumbing and electric work reserved), terra cotta work. Contract awarded to Frank L. Walley, Spring City, Pa.

Residence, Royersford, Pa. Architect, J. Vincent Poley, 162 Second avenue, Royersford, Pa. Owner, Mrs. Harry Saylor, Main street, Royersford, Pa. Brick and stone, 2 stories, 26x36 feet, oak and maple floors, pipeless heat, composition roof, tile work (heating, plumbing and lighting reserved). Contract awarded to W. A. Becker, Royersford, Pa.

Store and Apartment Building, Glenside, Pa., $18,000. Architect, H. Walton Heiss, Jenkintown, Pa. Owner, Fred E. Geuther, Glenside, Pa. Brick, 3 stories, 38x43 feet, slate and slag roof, composition, oak and pine floors, hot water heat, electric light, metal lath, bond. Contract awarded to Roy Randall, Horsham, Pa.

Bank Building, Hatboro, Pa., $27,000. Architect, A. Oscar Martin, Doylestown, Pa. Owners, Hatboro National Bank, Hatboro, Pa. Stone, 1 and 2 stories, 30x40 feet, 20x28 feet, demolition, tin roof, North Carolina pine floors, hot water heat, electric light, tile work, bond, ornamental iron work (bank fixtures, vault doors and linings reserved). Contract awarded to Roy Randall, Horsham, Pa.

Garage, Philipsburg, Pa. Architect, George S. Idell, 1705 Chestnut street, Philadelphia. Owner, W. C. Gould, Philipsburg, Pa. Brick, 1 story, 20x24 feet, asbestos shingle roof, cement floors, heating and lighting extensions. Contract awarded to William C. Rambo, Philipsburg, Pa.

Road Work, Pennsylvania. Owners, State of Pennsylvania, State Highway Department, Harrisburg, Pa.

Lehigh County, Route 226, Appli. 1523, North Whitehall and Heidelberg Townships, length 24,077 feet. One course reinforced concrete, $170,478.25. Contract awarded to Juniata Company, Empire Building, Philadelphia.

York County, Route 250-333, Fairview Township, length 22,806 feet. One course reinforced concrete and hillside vitrified brick. Contract awarded to Kumer & Graeber, Shamokin, Pa., $261,549.48.

Road Work, Pennsylvania. Owners, State of Pennsylvania, State Highway Department, Harrisburg. Lancaster County ,Appli. 2095, and Route 344, Quarryville Borough. One course reinforced concrete, $14,801.30. Contract awarded to Swangler-Fackler Const. Co., Lebanon, Pa.

Hospital, West Reading, Pa., $1,500,000. Architects, Ritcher & Eiler, 147 North Fifth street, Reading, Pa. Owners, Reading Hospital Board, Frank Livingood, president, West Reading, Pa. Brick, steel, concrete, fireproof. Plans in progress. Wyomissing Developing Co., Wyomissing Pa., will build.

Bank, Oak Brook, Pa. Architect, Harry Maurer, 234 Norrh 5th st., Reading, Pa. Owners, Reading National Bank, Reading, Pa. Brick and cut stone, 1 story, 30x53 feet, Carey roof, vapor heat, electric light, tile work, marble, mosaic, wood and tile floors, tile work. Contract awarded to C. H. Schlegel, 2250 Perkiomen avenue, Reading, Pa.

Store, Reading, Pa. Architect, Fred Muhlenberg, 24 North Sixth street, Reading, Pa. Owner, Lewis T. Ganster, 200 North Fifth street, Reading, Pa. Concrete and brick, 2 stories, 30x30 feet, asphalt roof, hardwood floors, steam heat, electric light. L. H. Focht & Son, Baer Building, Reading, Pa., will build on percentage basis.

Store and Apartment, Seventh and Cherry streets, Reading, Pa. Architect, M. B. Dechant, 632 Washington street, Reading, Pa. Owner, J. B. Waidelich, American Drug Store, Allentown, Pa. Brick, hollow tile, 4 stories and basement, 97x32 feet, slag roof, hardwood floors, steam heat, electric light, tile work, terra cotta. Contract awarded to Butz & Clader, Ainey Building, Allenown, Pa.

Road Work, Pennsylvania. Owners, State Highway Department, Harrisburg, Pa. Jefferson County, A-1958, Brookville Borough, 1,921 feet. One course reinforced concrete and hillside vitrified brick, $43,511.28. Contract awarded to W. C. Quick & Co., Brookville, Pa.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

New Jersey Construction News

Junior High School, Cadwallader street, Trenton, N. J., $1,000,000. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, School Board of Trenton, R. C. Belville, secretary, 9 South Stockton street, Trenton, N. J. Brick, steel, fireproof, 2 stories, 380x410 feet, slate roof, hardwood floors (heating, plumbing and electric work reserved), hollow tile, metal lath, safety treads, roof ventilators, marble and terrazzo work, waterproofing and dampproofing, terra cotta, iron stairs, ornamental iron work. Plans in progress.

Elks' Club, Fowler street, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, I. B. P. O. E., Sunlight Lodge, No. 114, Mr. F. Kinney, 120 North Warren street, Trenton, N. J. Brick, steel, 1 story, 60x80 feet, slag roof, maple floors, hollow tile, steam heat, electric light, tile and marble work, ornamental iron work. Architect will be ready for bids next week.

Residence, Ventnor, N. J., $150,000. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City. Owner, Hon. Walter E. Edge, 170 South Pennsylvania avenue, Atlantic City, N. J. Brick and stone, 2½ stories, hardwood floors, electric lighting, tile and marble work. Plans in progress. Too early for details.

Store and Offices, Atlantic avenue, Atlantic City, N. J. Architect, Byron H. Edwards, 34 South Seventeenth street, Philadelphia. Owner, name withheld. Brick, steel and limestone, 2 stories, 26x100 feet, slag roof, cement and pine floors, hot water heating, electric lighting, tile work, hollow metal skylights, iron work. Plans in progress. Architect will be ready for bids in two weeks.

Residence (alts. and add.), Woodbury, N. J. Architect, Richard R. Neely, 2126 Pine street, Philadelphia . Owner, S. Polsky, 240 South Broad street, Woodbury, N. J. Brick and frame, 2 stories, 74 x35 feet, slag roof, pine and mineral floors, hot water heat on second floor, electric extensions. Owner will be ready for bids in ten days.

Show Room and Garage (add.), 2719-21 Atlantic avenue, Atlantic City, N. J. Architect, Byron H. Edwards, 34 South Seventeenth street, Philadelphia. Owner, Carroll W. Brown, Atlantic City, N. J. Brick and steel, 1 story, 48x23 feet, slag roof, cement floors, metal lath, plate glass, metal bulks, electric lighting, fire doors. Owner will build.

Residence, 12 South Connecticut avenue, Atlantic City, N. J. Architect, J. R. Ogden, 143 South South Carolina avenue, Atlantic City, N. J. Owner, S. Fishman, on premises. Brick, 1 story, 18½x32 feet, slag roof, pine floors, hot water heating, electric lighting. Architect taking bids.

Residences (2), Stuyvesant street, Trenton, N. J. Owners, Rees-Taylor Co., American Mechanics' Bank Building, Trenton. Brick and frame, 14x47 feet, slate roof, pine floors, electric lighting. Owners will build.

Bridge, Alden street, Trenton, N. J. Architect, private plans. Owners, City of Trenton, N. J. Steel and concrete. Lowest bidders: Louis Seiling, Red Bank, N. J., $208,903; Carl R. Camp, 10 South Eighteenth street, Philadelphia, $218,666.

Bridges, Bridgewater and Bedminster, Somerset County, N. J. Engineer, John L. Vogel, 722 Broad street, Newark, N. J. Owners, State Highway Commission of New Jersey, Broad Street Bank Building, Trenton, N. J. Concrete and steel, 2 span, 45x30 feet, bond. Owners taking bids due November 15th. Deposit, $10.00.

Lumber, Trenton, N. J. Owners, State Highway Commission, Broad Street Bank Building, Trenton, N. J. Bids will be received on November 21st at 11 A. M. for furnishing 487,400 feet B. M. of lumber for use on the Ocean City-Somer's Point bridge. Delivery to be made F. O. B. cars at railroad siding at Ocean City. Certified check for 10% of amount of bid.

New Jersey Contracts Awarded

Bank, Audubon, N. J. Architect, Harold Allen, 526 Stevens street, Camden, N. J. Owners, Audubon National Bank, Audubon, N. J. Brick, cut stone, steel and reinforced concrete, 2 stories, 40x66 feet, slag roof, cement and maple floors, metal lath, hot water heating, electric lighting, tile and marble work, terrazzo work, bond. Contract awarded to Hugh B. Miller, Edgewater Park, N. J.

Warehouse, Baltic and Baltimore avenues, Atlantic City, N. J. Architect, Samuel Abramson, 2315 Walnut street, Philadelphia. Owners, Fleck Brothers, 50 North Fifth street, Philadelphia. Brick, 1 and 2 stories, 85x175 feet, slag roof, concrete and pine floors, hot water heating, electric lighting. Contract awarded to N. Neddleman, Atlantic City, N. J.

Residence, South Orange, N. J. Architect, William Klemann, First National Bank Building, Trenton, N. J. Owner, H. Herring, South Orange, N. J. Frame, 2½ stories, 27x28 feet, shsingle roof, hardwood floors, steam heat, electric light, tile work. Contract awarded to Harry Bell, Irvington, N. J.

Residence, Morris Heights, N. J. Architects, William Slack & Son, St. Regis Theatre Building, Trenton, N. J. Owner, J. Howard Ronan, 1305 West State street, Trenton, N. J. Frame, 2½ stories, 32x30 feet, shingle roof, hardwood floors, electric lighting, heating undecided. Contract awarded to A. Bowers, Dutch Neck, N. J.

Residence, Morris Heights, N. J. Architects, William Slack & Son, St. Regis Theatre Building, Trenton, N. J. Owner, Mr. Lester Bingley, 211 Perry street, Trenton, N. J. Frame, 2½ stories, 32x30 feet, shingle roof, hardwood floors, electric lighting. Contract awarded to Lewis Bowers, Dutch Neck, N. J.

Residences (2), Melrose avenue, Trenton, N. J., $8,000. Owner, H. Miller, care of builder. Brick, frame, 2 stories, 14x39 feet, slate roof, pine floors. Contract awarded to L. J. Wilson, 916 Melrose street, Trenton.

Club House, Trenton, N. J., $7,000. Owner, J. C. Hill, 7 West State street, Trenton, N. J. Frame, 2 stories, 22x65 feet, slate roof, pine floors, electric light. Contract awarded to W. Schaefer & Son, 1045 South Broad street, Trenton.

Miscellaneous Construction News

Gymnasium and School (add.), Baltimore, Md. Architect, Louis Levi, Real Estate Trust Building, Philadelphia. Owners, Madison Avenue Temple, Baltimore Hebrew Congregation, Baltimore, Md. Brick, steel, stone and concrete, gymnasium 54x63 feet, 4 story add. to school, 21x65 feet, slate and Johns Manville roof, pine floors, steam heating. Architect taking bids due November 13th.

Church (alts. and add.), Ridgely, Md. Architect, John A. McKibbin, Industrial Trust Building, Wilmington, Delaware. Owners, St. Benedict's Church, Rev. Joseph A. Lee, Ridgely, Md. Frame, 30x70 feet, shingle roof, general alterations. Plans in progress.

Residence (alts.), Cooch Bridge, Delaware. Architect, E. C. May, Dupont Building, Wilmington, Del. Owner, Edward W. Cooch, Equitable Building, Wilmington. New partitions, hardwood floors, general interior alterations. Plans in progress.

Board of Temperance Building, Maryland avenue and First street, N. W., Washington, D. C., $500,000. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, Board of Temperance, Prohibition and Public Morals of the Methodist Episcopal Church, Washington, D. C. Brick, reinforced concrete, cut stone, limestone and steel, 5 stories and basement, 128x36x151x36 feet irregular, slag and asphalt mastic roof, composition, concrete and maple floors, hollow tile, metal latah, safety treads, roof ventilators, iron work, floor hardener, bond, kalamein and tin clad doors, rolled steel sash and skylights, tile, marble and terrazzo work (heating, lighting, plumbing, refrigeration and elevators separate bids). Contract awarded to Boyle Robertson Co., Washington, D. C.

(Continued from page 712)

most modern heating practice. Such a study in a theoretical one-story building 500 by 200, for example, shows that the type of roof can effect the initial cost of the heating system in such a building some $10,000 and the annual expense for fuel as much as $7,000."

Proper insulation is also a necessity in maintaining comfortable temperatures during hot weather in upstairs rooms of residences, loft work-shops, and the top floor of apartment buildings. In the case of the latter, these suites would undoubtedly be most desirable if the heat in summer was not almost unbearable at times.

In special process factories, such as paper and textile mills, bakeries, candy rooms, etc., where high humidities occur, insulation is installed to prevent the condensation of moisture on ceilings or walls. The same treatment is also effective in gymnasiums and similar rooms where the roof slab forms the ceiling or in buildings where the air is scientifically humidified. An effective illustration of condensation in a minor form which is unsightly and causes frequent redecorating, is the discoloration of ceilings under unheated spaces. The joist and lath marks which appear are due to the fact that moisture condenses on the coldest surface. The coldest surface on the ceiling is between the lath, where, by the way, there is twice as much plaster as over the face of the lath and dust settles in this moisture. Under the lath there is more protection and less condensation, hence less dust, and under the joists or rafters, which afford all the protection needed, the ceiling maintains its natural color. Particularly is this true of churches and public auditoriums where ceilings are high, causing an unusually large temperature difference. Decorating in this type of building is very expensive and can be minimized by the correct use of insulation.

While the amount of insulation and its application naturally varies with the particular type of construction and the re-

sults desired, it can be safely said that the applied cost will be rapidly repaid by the fuel economy effected. In addition, the initial cost of installation can be largely and in some cases entirely offset by a reduction in radiation and boiler capacity.

The following items have been taken from a report of tests made by the Bureau of Standards, Washington, D. C., to give the reader an idea of comparative insulating values. Figures given indicate the heat transmission in B .T. U. per square foot, per degree difference in temperature, per twenty-four hours, per 1 inch *thickness.*

Gypsum Plaster, 56.0; Virginia Pine, 23.0; 85% Magnesia, 12.0. As compared to these materials, there are several commercial insulators in the market having transmissions varying from 6.5 to 8.0. In selecting such a material its cost should be determined on its thermal value as furnished for commercial use as compared to that use in test work.

Whether the building be a home or a factory, if it is to be heated, there is a definite need for insulation. From the standpoint of comfort and economy every thoughtful designer and builder should advocate its use as a big step toward better construction.—*Building Industry.*

THE COAL CRISIS CREATES POPULAR INTEREST IN HEATING SMALL HOMES BY OIL

BY A. V. HUTCHINSON, in *Building Age*

Every home bulider's ambition is to discover some way of having his home heated to a comfortable temperature, without the exertion required to shovel in coal and shovel out the ashes, as well as to eliminate the dust and dirt accompanying these operations. His wish, to just push a button and have heat, can be gratified now, thanks to skill of engineers, who have attained their objective in perfecting oil burning equipment for small house heating plants.

Just imagine being able to lie in bed and know that the house will be at a temperature of 70 deg. in the morning without any effort on your part, or that just the throwing of a switch in the bedroom will start the burner immediately. Many reasons can be found for the impetus given fuel oil burning devices beside coalless days, shortage due to strikes and transportation and high prices.

The advantages that recommend fuel oil for domestic use are its cleanliness, uniform temperature and flexibility in meeting weather change, efficient and smokeless combustion, the fact that it is not affected by weather conditions, that less labor is required for operation, ash removal and minimum space needed for storage.

The present styles of oil burning devices are in the nature of attachments to existing types of coal burning boilers and furnaces, which can be quickly and economically changed for attaching the oil burner. The most important items are the installation of the oil storage tank and piping, which are governed by the fire underwriters' rules and local ordinances. Four distinct types of burners have been developed, and each has a big following in its particular section.

One of the first places to use oil for heating the home was the Pacific coast, and special burners for California crude oil were made. Oil burners also have made their appearance in the Middle West and East, and are adapted for the kind of fuel oil available. These have withstood the severe test of actual service for several years with entire satisfaction to the owners both from a service and cost standpoint.

Where the winter weather is severe, burners that are automatically controlled are popular, while in the far west, where intermittent service is all that is required, rotary burners are in the leading position. They burn a heavier grade of oil than the other types found farther east. In recommending which is the right burner for a house heating plant the builder should consider the following factors: Is service or economy desired? What will be the nature of the service required? Is fuel oil easily obtainable? What is the best type of burner?

For ideal heating the two governing factors are efficiency and economy, and when oil is used as the fuel these two conditions rest to a large extent upon the burner. Efficient service requires that the burner must be positive in action, able to operate over long periods without attention and convert the oil into such form that the greatest amount of heat will be realized from a given amount of oil, without noise or dirt.

A vaporizing type of burner is designed for round steam and hot water boilers rated up to 500 sq. ft., warm air furnaces with fire-pot diameters of 18 to 26 in., and in a different arrangement for square sectional end boilers. The burner is held in the fire-pot on a standard, the goose-neck of the manifold resting on a fire-door ledge. Oil from a cellar tank flows under pressure to the vaporizing tube or generator, from which the vapor flows through a hand-controlled needle valve into the manifold to the burner heads. The height and volume of the flame are controlled, and there are no moving parts to get out of order. To start the burner either a gas flame or an alcohol primer is used. The cellar storage tank is fitted with an air gauge and motor driven air compressor or hand pump if electric current is not available. Little attention is required by this burner, it being necessary to regulate the flame about twice a day, the air compressor being automatically controlled.

Automatic Working Systems

Three burners atomizing the oil mechanically and operating under themostatic control are the Nokol, Aeroil and Williams. A uniform temperature of 70 deg. or any other desired temperature can be maintained, and the home owner need never worry about going home to tend to the fire.

Nokol consists of a theremostat and electrical control box attached to a blower or atomizer, a combustion chamber with constantly blowing pilot light and oil storage tank. Oil flows to float chamber, where needle valve maintains proper level. Action of themostat starts blower, causing fine spray of oil to be fed in combustion chamber, where pilot light ignites it. Safety devices will shut off oil if pilot light fails, if dirt interferes with needle valve action the machine will stop, failure of current will cut off oil, so that every precaution has been provided. Nokol is made for steam and hot water boilers and warm air furnaces, and has received approval from the National Board of Fire Underwriters.

Aeroil is a burner made in four sizes *to* handle house heating boilers rated from 500 to 10,000 sq. ft. of radiation. A motor driven blower and oil pump are mounted on standards directly in front of the feed door, and the oil and air line enter the fire chamber, turn downward and discharge the flame against a special deflecting plate resting on the grate. When the thermostat acts the oil lights from a constantly burning pilot light, the burner operating until the home is raised to the proper temperature.

The Williams burner is automatic, oil being delivered to an atomizing chamber, where it is mixed with the correct amount of air supplied by a blower driven by an electric motor. A special control switch and themostat complete the equipment, which will handle house heating systems rated up to 10,000 sq. ft. of steam radiation.

Atomizing by Steam

Oil for the Caloroil burner is atomized by means of steam, a generator being mounted on the base plate located in the firebox of the heater. An oil tank supplies the oil nozzles automatically, water is supplied from the city main to the steam generator, and the steam escapes from specially designed nozzles and combines with the required amount of oil and air for proper combustion. A gas or gasoline primer is provided for starting the burner, and the control is by means of a thermostat if desired.

All of the rotary types of burners are hand-fired, as they are used in communi-

ties where intermittent heating is required. The intense flames made by these burners make it necessary to brick-up the fire-pot of the heater for best results.

The ray burner is a very compact unit, consisting of a totally encased motor with extended hollow shaft to center of which worm gear is fastened, and with blower and atomizer at opposite ends. It is made in a number of sizes for boilers and furnaces, for either direct or alternating current. The burner is fastened to the ash-pit door hinged so that it can be swung out of the way.

Atomizing by Centrifugal Force

In the Johnson rotary burner the oil is atomized by a centrifugal device and is made for heating plants rated up to 10,000 sq. ft. of steam radiation. The fire is started by closing the motor switch, turning on the oil regulating valve and holding a light in the fire box. Thermostatic action will turn off the burner when the proper temperature is reached. Johnson burners are made for either direct or alternating current, are hinged to the ash-put door and are made with or without oil pump.

An oil burner for boilers as small as 250 sq. ft. rating are the Fess types. Oil is atomized by rotary action and mixed with the right amount of air supplied by a blower. Air and oil are carried by separate lines, and a novel burner construction produces an intense but soft flame.

Efficiency of House Heaters

Experience and test have shown that the effifficiency of house heaters had been raised by 15 to 20 per cent. when oil fuel is used. Quicker response from the heater is possible and greater efficiency is obtained from fuel oil. It must always be remembered, however, that a heating plant with an oil burner attachment is only as efficient as the boiler or furnace to which it is attached even though all of the heat units are obtained from the oil.

What Will It Cost?

One of the particularly pertinent questions that will be brought up by the home builder will be, "What will it cost to heat with oil?' This cannot be answered for the whole country by one statement, but an outline of some of the factors entering into the selection, installation and operation of oil burning units should be considered, and will give a basis for accurate judgment. First is character of building; second, style condition and efficiency of heater, amount and cost of coal consumed, labor and cost of ash removal and firing of coal, dirt and inconvenience involved.

It has been found that 100 gallons of oil will do the same work as 1 ton of high-grade coal when good operating conditions exist. The oil used in the vari- burners ranges from 26 to 39 Baume, so that by getting the price of the kind used it is easy to figure how it will compare with coal cost. Tank wagon delivery for New York is about 8 cents per gallon.

Figures on Oil Consumption

A Chicago installation, with an automatically controlled mechanical atomizing burner ,operating for 151 days during the 1920-21 heating season, in a steam boiler supplying 475 sq. ft., consumed 1,585 gallons of oil, or an average of 3 gallons per hour, to maintain a constant temperature of 70 deg. As the maintaining of a uniform temperature with coal is possible only when constant attention is given the heater, and, as this is infrequent with the average home installation, it is safe to assume that when coal was burned in this house during the night, when the fire was banked, that the room temperature was around 50 deg. for some hours. This might mean that a little more than 100 gallons of oil was used to a ton of coal, though no figures are available. However, the owner feels satisfied that the comfort derived more than compensated for the few extra dollars.

With the average house construction and to be on the safe side figuring an oil consumption of 100 to 120 gallons of oil equal to a ton of coal would be good practice. The vaporizing burners will show a lower fuel consumption than the mechanical burners, and these figures can be baten if thermostatic operation is used only in severe weather.

Study of Fuel Oils

Some knowledge of the properties of fuel oil are desirable, for the oils from the different fields vary in content, but vary slightly in heating value. Fuel oil is a refinery by-product resulting from the distillation of crude petroleum. It is heavier than the crude from which it comes, and will not burn readily until atomized or vaporized and mixed with the proper amount of air. A blazing stick or live coal will die out before it will ignite the oil.

The question of oil supply and storage are of vital concern when considering its use for heating. Present production and consumption, though very large, will not exhaust available supplies for many generations, and in this country large untouched shale areas promise much, according to Geological Survey reports. Present pipe line transportation methods from oil fields to refineries insures a continuous supply in all kinds of weather, so that in areas adjacent to refineries and distributing centers plenty of fuel oil is assured.

Storage of Oil

The reserve storage tanks, recommended by burner makers to house owners, range from 250 to 1,000 gallons capacity, depending on the estimated consumption. On the Pacific Coast as much as a month's supply in reserve is often provided.

Underwriter's rules and local ordinances govern the storage of oil in homes and the burner manufacturers have met these specifications in designing their apparatus. Pumps, air pressure, hydraulic, gravity (where permitted), and other patented systems are used and have been perfected and simplified.

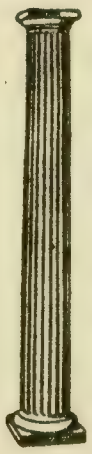
Less Space Needed

In addition to the cleanliness and other advantages of uniform temperature, ease of control and minimum attention required when oil is burned, the home builder can figure to use the basement or cellar for something more than a rough storage space.

With a little space necessary for oil storage plenty of room is available for a billard room, playroom, maid's room or something of the kind, which would be impossible when coal is used, because of dust and dirt and the room it requires for its storage—about 45 cubic feet per ton.

Advantages to Builders

Also there is the commercial side, for the builder who sells his house. If an oil system with its many advantages is installed an exceedingly good scales and service argument is available, and the house will commend a better price with but little extra initial cost. There are many places where oil can be successfully used for heating the home, but care should be exercised so that perfect satisfaction will be assurred.



All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

As The Editor Sees It

EVERYONE is well aware of the scarcity of both common and skilled labor for the building trades. The scarcity of common labor is greatly augmented by the present restrictive immigration laws, for, after a man has been in this country for a while, he is very apt to graduate from the common labor class, and industry turns to immigration for a new supply. New methods must be devised to make up for this shortage, and, as necessity is the mother of invention, contractors are already beginning to solve this problem. Dow service tells us that in New York "scarcity of common labor has forced excavating contractors to employ mechanical digging, hoisting and carrying devices. In other days it was almost impossible for human brawn to make profitable progress against frost, snow, ice and sleet. Then it was necessary to wait until the spring thaws came before rock and earth work could be started. Now these factors are no real barriers and by the time the excavating work is finished, the rail deliveries are less likely to be delayed by snow and storm and the operation goes through with better progress and is in better position to be handled by the renting agents than are those, forced to operate on over-time bases toward the finish of the job, thereby often adding considerable to the cost of the building, in extras, etc."

Complaints are heard that not enough men are entering the ranks of apprentices to meet the demands for skilled labor, and in every city ways and means are being devised and discussed to make apprenticeship more alluring. Quite the last word along this line is the recent step taken by the New York Building Congress, and in *Building Industry* we read:

New York Building Congress to Make Carpenters

Bulletin No. 2 of the New York Building Congress gives the entire modus operandi of making mechanics in the wood working trades.

There is every evidence of much hard and conscientious work on the part of men composing the General Apprenticeship Committee and it will be most interesting to see to what extent their honest and intelligent efforts are rewarded by the young men who are presented with every opportunity of becoming proficient and useful craftsmen.

After reading the thirty rules and regulations and the so-called exhibits, one can almost envision the apprentice riding to his place of employment in a limousine with liveried chauffeur, a wreath of bay leaves on his head and a group of young girls, clad all in white, strewing flowers in his path, while his employer backed by the entire office force waits with due reverence and uncovered head, the coming of one who with the approval of the Building Congress and the Building Trades Council has consented to accept at has hands, an education combined with a liberal stipend.

Rules 18, 19 and 20 provide that "the course of study to be taught apprentices in school instruction shall include related mathematics, trade sketching and drawing, shop practice, related science, general information as suggested, in Exhibit 'E', discretionary on development as related to job employment of the apprentices at the time the instruction is given which shall conform to city and state educational requirements."

"The apprentice shall be supervised at work and in school by highly qualified educational experts who shall report periodically to the General Apprenticeship Committee as to the progress and satisfaction rendered."

"A complete record of the apprentice's performance shall be kept by the educational advisor of the Congress and reported semiannually to the Carpenters' Joint Committee— being subject to examination at all times."

And what, one asks, does the apprentice pay for all this fostering care and education? Not one penny beyond one day's pay twice a year. On the contrary he is awarded most liberally for accepting all these advantages.

His employer is supposed to pay for the privilege of educating him, a daily wage for the first six months equal to 30% of that paid a skilled mechanic. Such

BLUE PRINTS

wage to increase substantially at the end of each six months period until the ninth six months shall have brought his wages up to the journeyman's level, after which, if no position as foreman or superintendent is open, he may consent to remain employed under a foreman who is necessarily far beneath him or he may go into business for himself. In which latter case he will, of course, bless the system which created him.

Rule 21 says "In case of a dissatisfaction on the part of the employer or the apprentice, either one has the right and privilege to appeal at any time to the General Apprenticeship Committee of the Congress for the necessary action and adjustment."

This rule is of special interest as it makes a distinct reference to the employer, the man who is allowed to pay, and actually concedes to him, under this particular rule, equal rights with the apprentice for which he should be duly grateful.

Here are the influences that watch over the apprentice during the period of his apprenticeship and have more or less authority over him.

The New York Building Congress, the General Apprenticeship Committee, the New York Building Trades Council, the Federation of Labor "the highly qualified educational experts" who "supervise his work," the Carpenters' Joint Committee, the City Board of Education and—let us see—Oh, yes, the employer, who pays the princely wages which are apparently based on the fact that the boy, being at least sixteen years of age has a family to support.

All this relates to the making of a carpenter and it proves successful may be applied equally well to other trades.

It may work out perfectly in New York, we hope it does, but are are skeptical of the success of its operation in other localities, particularly those in which the employer is, at least nominally, still the boss.

John A. Quinn, of Philadelphia, chairman of the Apprentices Committee of the Master Plumbers' Association, appeared before the Industrial Board Department of Commerce and Industry of Pennsylvania to explain what training their Association is giving to the apprentices in this trade.

The Plumbers' Association, he said, is co-operating with the Philadelphia Trade Schools in connection with the Public Schools System. Their program is to take the boy from high school and instruct him in the essentials of the plumbing industry.

Commissioner C. B. Connelley, Department of Commerce and Industry, State of Pennsylvania, asked why they waited until the boy is out of high school before teaching him the trade. Quinn replied that it was done to assure them that their apprentices have the value of business training and general intelligence to insure a higher type of men in the trade.

"You would be surprised to know how many plumbers today know little about business. There are some plumbers, I am forced to admit, who do not know how to make a bank deposit."

The full committee of the Plumbers' Association will appear before the Board at an early date when the question of apprenticeship will be discussed at length. The Indutrial Board has jurisdiction in apprenticeship training only insofar as it applies to the enforcement of the Child Labor Law.

AIMS AT STABILIZING CONSTRUCTION

New York Building Congress Works on Plans to Keep Labor Employed Steadily

Makes Recommendations

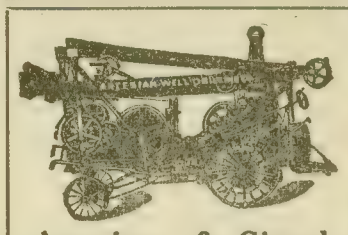
The New York Building Congress is initiating a program to reduce the cost of building by adding more seasons to the industry, thereby eliminating both the rush periods, when bonuses are frequently paid, and the periods of unemployment.

As a result of a survey, which lasted four months, it was found that custom is really the biggest influence in causing the peak loads on the demand for labor, especially during the renting seasons. Careful business foresight is needed more than anything else to effect lower costs, with less waste, higher quality of workmanship and greater production, according to the reports.

Rental Periods a Factor

The periods for renting three distinct types of construction, apartments, loft buildings and commercial buildings, have an important bearing on the labor demands. Apartments are built to be ready for occupancy by October 1, loft buildings by February 1, and commercial buildings by May 1.

The new construction most subject to control is Government and municipal work, religious and educational structures and private residences.



Five Recommendations

As an aid to all factors interested in construction, the Congress makes the following recommendations:

1. Establish a wide range of rental dates.
2. Regulate governmental, religious and educational and private building to come during the low period.
3. Encourage beginning work earlier.
4. Plan repair work for low period.
5. Whenever possible, adapt demand for inside and outside work to available labor.

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls

For Preserving Brick-Stone-Stucco-Concrete

THE TRUSCON LABORATORIES —

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., November 10, 1922. Sealed Proposals will be received at this office until 3 P. M., December 4, 1922, and then opened for an extension to the building and driveway, and remodeling, at the United States Court House and Post Office, at Altoona, Pa., in accordance with the specification and drawings mentioned therein, copies of which may be had at this Office or at the office of the Custodian, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

Contracts Awarded

Residence and Garage, Ocean City, N. J. Architect, A. C. Borzner, 717 Walnut street, Philadelphia. Owner, George S. Russell, Land Title Building, Philadelphia. Frame and stucco, 3 stories, 30x50 feet and 9x19 feet, shingle roof, electric lighting, pine, cement and hardwood floors. Owner will take bids.

Factory, North Clinton street, Trenton, N. J., $6,000. Architect, private plans. Owners, Empire Tire & Rubber Co., North Clinton and Mulberry streets, Trenton, N. J. Steel, frame and brick, 1 story, 48x90 feet, slag roof, rolled steel sash. Owners will build.

Store and Residence, Bellevue avenue, Trenton, N. J. Architect, private plans. Owner, G. A. Smith, 613 Edgewood avenue, Trenton, N. J. Brick, 2½ stories, 16x28 feet, slate roof. Owner will build.

School, Trenton, N. J. Architects, associate, William H. Slack & Son and E. Sibley, Trenton, N. J. Owners, Board of Education, County of Mercer, Trenton, N. J. Brick and steel, 2 stories and basement, 130x24 feet and 156x55 feet, 124x50 feet and 53x99 feet, slag roof, cement and maple floors, metal lath, dumb waiter, roof ventilators, dampprooofing, iron work and stairs, floor hardener, bond, hollow metal doors, rolled steel skylights, tile, marble and terrazzo work (heating, etc., separate bids). Lowest bidders: Karno Smith, Trenton, N. J., $448,000; Charles J. Smith, Trenton, N. J., $454,217. Electric, Biard Osterhout Co., 2109 Walnut street, Philadelphia, $15,000. Heating, Dechman Plumbing & Heating Co., Camden, N. J., $50,988. Plumbing, Trenton Plumbing & Heating Co., Trenton, N. J., $29,986.

New Jersey Contracts Awarded

Twin Residences, 233 South Olden street, Trenton, N. J., $8,000. Architect, private plans. Owner, Samuel Wyers, 824 Quinton street, Trenton, N. J. Brick, 2½ stories, 14x42 feet, slate roof, pine floors. Contract awarded to Jackson Brothers, Trenton, N. J.

Miscellaneous Construction News

Residence and Garage, Winston-Salem, N. C. Architect, Charles Barton Keen, Bailey Building, Philadelphia. Owner, C. A. Kent, Winston-Salem, N. C. Brick and hollow tile, 2½ stories, slate and tile roof, oak floors, vapor heating, electric lighting. New plans in progress.

Church, Washington, D. C. Architects, Charles W. Bolton & Son, Witherspoon Building, Philadelphia. Owners, Calvary Methodist Episcopal Church, Washington, D. C. Brick and stone. Plans in progress.

Factory, Milford, Delaware. Architect, private plans. Owners, Cellulose Products Co., Charles A. Camillo, president, Marcus Hook, Pa. Plans in progress. Too early for details.

Boat House, Upper Saranac Lake, N. Y. Architect, Paul Livingston Boyd, 6943 Limekiln Pike, Philadelphia. Owner, George H. Kirby, care of architect. Frame, 2 stories, 37x36 feet, shingle roof. Contract awarded to Arch K. Schock, 45 West Green Lane, Chestnut Hill, Philadelphia.

WHAT ARE BUILDING COSTS?

BY A. P. GREENSFELDER, *Fruin-Colnon Contracting Co., St. Louis, Mo.*

People frequently discuss building costs as if bricks and bricklayers, materials and labor were the only items worthy of consideration. Broadly speaking, men and materials do comprise the total expense in construction work, just as they do in any other article produced by civilized man.

What we wish to emphasize, however, is that most people really think that the walls and floors of a building, the visible completed objects, are the only costs that enter into the expense of erection. They think differently, however, when they find it ncessary to buy a stick of wood at the lumber-yard or a pair of hinges at a hardware store, which may be needed for an extra partition after they have moved into the new building.

From their own books business men know just the sort of expense items they must add to the cost for fixed charges, operating expense and legitimate profits. They understand that their selling prices must include rent, taxes and insurance, contingency charges, interest and profits.

Builder Has "Overhead"

The builder is a merchant. He is also a manufacturer, differing from the usual producer in that the builders factory is portable and frequently without a roof, at least until nearly the end of the job. The builder has a fixed office, a warehouse and yards for storage of machinery and materials. The annual upkeep of these adjuncts must be sustained by field construction executed during the year.

The builder also has selling expense. He must advertise and call upon architects, engineers and owners before he secures a customer. He must pay his estimator to make a quantity survey of the plans, because the owner does not tell him what he tells everybody else he buys from—the quantity of materials he wants to purchase. The builder's purchasing agent then locates the materials at market prices; and, after careful estimates are made, conference held and a financier consulted, a contract is made with a future owner and the builder assumes the title and agency of a contract.

As agent, the contractor arranges to incur the following expenses: surety bonds, liability, fire and tornado insurance, building permits, water license, city inspection fee, temporary public utilities service, transportation of materials and drayage of equipment. Not a single item would be visible to a visitor to the building site, and yet they may constitute 10 per cent. to 15 per cent. of the cost. Then there is bank interest, because the owner does not advance money for payrolls and material bills. There is also ice and coal, oil, stationery, carfare, postage, rope, perishable tools, scaffolding, demurrage, war taxes and other miscellaneous items which are consumed.

Equipment Costs High

On a job of any size at all, the contractor must provide labor-saving equipment, such as concrete mixers, steam shovels, derricks, hoisting machines, power saws and similar machinery. While they are truly labor-saving and produce economy, they cost about 4 per cent. of their value each month. Then there is the greatest of intangibles, brains, which, mingled with experience, knowledge, good judgment, aptitude and industry, produce that supervision which makes for good results. Brains insure satisfactory service. This is represented in the contractor's organization in many ways. The ablest superintendent, for instance, makes the fewest mistakes, has initiative, plans his work ahead, keeps his men working cheerfully together and gets a quality job done ahead of time within the estimated cost. Such men earn good wages and are worth it. Every merchant and manufacturer knows how scarce leaders are.

Then appear such contingency items as frost, rain, labor strikes, railroad delays and accidents, many of which are common to most industries, but all of which frequently confront the contractor. The law of averages applies the proper charge on such items to the work. Finally, to the actual outlay for materials and labor must be added a remuneration for the contractor sufficient to induce him to remain in business, subject to hardships and risks, and yet keep his financial credit good enough to start the next job.

Do you still think men and materials embrace all building costs?—The Constructor.

September was the fifth consecutive record-production month in the portland cement industry according to figures of the United States Geological Survey just released. Daily production was at the rate of 381,000 barrels, as compared with 376,000 in August, the best full month on record. Since April production has been at a monthly rate well over 1,000,000 barrels in excess of the best previous month on record. Shipments during September, although totaling less than August, because of transportation difficulties and car shortage, were at the rate of over 1,600,000 bags per day. (There are four baks in a barrel of 376 pounds.)

As portland cement enters into practically every form of construction and is used as soon as shipped during summer months, figures as to shipments of that commodity serve as the best index of construction activity. The enormous construction program now under way is the biggest single factor in hastening the return of business prosperity.

Shipments of portland cement this year will probably total close to 110,000,000 barels, as compared with 98,000,000 during 1920, the best previous year. For the past five months portland cement plants of the country have been producing at the rate of 137,000,000 barrels per year, which means that when the farmers and the railroads again enter the construction market, there will be plenty of this useful material to meet their needs.

That the popularity of steel basement windows will increase among home builders, as did the use of steel sash among industrial builders, is unquestioned. Ten years ago, steel sash was practically unknown among the building trade. Today, it is used in factory buildings, stores, office buildings, schools, banks and even hotels. This increased use of steel sash has been brought about by educating building owners, architects and contractors to its many advantages. In like manner, the home owner, contractor and architect will come to look upon steel basement windows with favor and satisfaction.

Steel basement windows have several important advantages over wood windows that are sure to appeal to the thoughtful home owner and builder.

They admit from 40% to 80% more daylight for the same sized masonry opening. The sash and frame are made from solid, narrow, rolled steel bars, eliminating the wide wooden members and permit the use of larger glass lights.

Steel windows cannot stick or warp. The difficulty experienced by every home owner in trying to open or close his windows, when the sash has swollen and stuck, is entirely eliminated. Steel is not affected by moisture.

Screens may be attached easily to the outside of the frames. Holes are punched through the frame so that special screen frames are unnecessary.

Because of their construction, steel windows resist fire and stand up under hard usage. They always have a better appearance than wooden windows, and add to the attractiveness of a house.

Here is one fact of interest to contractors and builders. Steel windows with channel frame construction save labor and expense in installing. This type of window will set upright on the still without bracing and it has the important additional advantage of serving as a guide to the mason. The channel frame makes it impossible to build the wall so close that it will bind the ventilator. The outside leg of the channel frame is somewhat longer than the inside leg. The mason builds the wall snugly against the front leg, filling the channel with mortar as he goes up. Anchorage is secured by means of four straight flat pieces of steel about 1″ by 4″ long. These are laid in the mortar joints in such a way that the ends extend about ½ inch into the channels at the jambs.

One advantage of steel basement windows, which appeals to architects, contractors and dealers, alike is the fact that they are standardized and made in only a few popular sizes. This assures the architect or contractor that he will not have the delay, the extra cost and trouble which invariably accompany the purchases and installation of special sized wood windows and also permits the dealer to carry a sufficient stock with only a small investment, and sell at a price commensurate with wood.

Another point in favor of using steel basement windows is that of low initial cost both to the home owner and building supply dealer. Not only are they quoted at a price that successfully competes with wooden windows, but an additional saving is also effected, by the fact that these steel windows are completely equipped, sash hung, priming coat of paint applied, and all hardware in place.

COMPARATIVE STRENGTH OF AIR-DRIED AND KILN-DRIED WOOD

Some wood users claim that kiln-dried wood is brash and not equal in strength to wood that is air-dried. Others advance figures purporting to show that kiln-dried wood is much stronger than air-dried. But some 150,000 comparative strength tests, made by the Forest Products Laboratory, of the U. S. Forest Service, on kiln-dried and air-dried specimens of 28 common species of wood show that good kiln drying and good air drying have the same effect upon the strength of wood.

The belief that kiln drying produces stronger wood than air drying is usually the result of failure to consider differences in moisture content. The moisture content of wood on leaving the kiln is generally from 2 to 6 per cent. lower than that of thoroughly air-dried stock. Since wood rapidly increases in strength with loss of moisture, higher strength values may be obtained from kiln-dried than from air-dried wood. Such a difference in strength has no significance, since in use a piece of wood will come to practically the same moisture condition whether it is kiln-dried or air-dried.

It must be emphasized that the appearance of the dried wood is not a reliable criterion of the effect the drying process has had upon its strength. The strength properties may be seriously injured without visible damage to the wood. Also, it has been found that the same kiln-drying process can not be applied with equal success to all species. To insure uninjured kiln-dried material, a knowledge of the correct kiln conditions to use with stock of a given species, grade, and thickness, and a record showing that no more severe treatment has been employed, are necessary.

METHODS OF PLACING CONCRETE IN COLD WEATHER

BY A. J. R. CURTIS, *in Building Age*

None of the radical departures in building operations during the last few years carries greater economic possibilities than that of carrying on these operations continuously or nearly continuously throughout the year. Frequently, closing down for the winter means the loss of valuable time in the fall as well because of the fear that work started in moderate weather may continue after cold weather sets in.

Most building materials are easier to procure in the winter and sometimes at lower cost. Labor is usually more plentiful and labor turnover is less. Winter interruption to his business often means that the contractor has to rebuild almost an entire trained organization—frequently including technical and superintending forces and fifteen or more different trades —every spring.

Winter construction costs are usually somewhat higher, but nearly always worth more than they cost to the owner, because his income or benefits from the structure start months sooner and to the contractor because he can complete the work, take out his payments and look ahead to the next job. The construction season is thus profitably lengthened for both owner and contractor.

About the only important obstacle to winter construction has been the lack of an nuderstanding and application of the relatively simple precautions necessary t successful winter concrete work. Much winter concreting has been done successfully during the past ten years and some of the largest and finest construction work of the war period was completed with the thermometer around the zero point.

The contractor who carefully plans ahead can often complete all concrete portions of a job before severe cold weather sets in so that the remainder of the work may proceed regardless of outside temperature conditions. Concrete work started in October and November is usually subject to considerable economies, for concreting crews work most efficiently during moderate or cool weather.

Planning for Winter Concreting

The contractor who expects to undertake building work likely to involve placing of concrete in freezing weather will do well to arrange as early as possible for

necessary supplies of sand, gravel and stone. Rail priorities given to facilitate the movement of coal have already made it difficult to obtain cars for the movement of concrete materials and this situation can hardly be expected to improve until coal requirements have been taken care of.

Gravel pits cannot operate in the winter and they are usually compelled to close down with the first hard freeze. Materials wet in transit and frozen in the car are difficult and expensive to thaw out and unload. These facts are stated to emphasize the importance of arranging early and carefully following up deliveries of concreting materials.

Principal preparations for cold weather concreting consist of providing or conserving heat in the presence of sufficient moisture so that the concrete can harden uniformly and with reasonable rapidity. If concrete freezes, the hardening action stops, for the water, which must be depended upon to react with cement, has changed to ice and, as is well known, cement and ice do not react nor does concrete harden while frozen; but the formation of ice is accompanied by expansion which may spall or disfigure the surface of the work or interfere considerably with the strength.

For a period during the fall, the temperature at night may go down to freezing, although quite moderate or even warm during the day. It is usually possible under these and similar weather conditions to take care of concrete work satisfactorily by covering the work carefully in order to trap the heat present, when the concrete was placed, keeping out cold winds, rain and sleet. Even where the temperature does not go below freezing, covering the work is beneficial in hastening the hardening.

Protective Coverings

The nature and duration of this protection depends upon the character of the work to be protected and prevailing temperature conditions. Every covering should be tight, to resist and keep out wind and water. Beware of holes, tears or openings of any kind and be particularly careful to amply protect exposed producing portions of the work.

Contractors generally prefer tarpaulins as the most adaptable covering for concrete work of various kinds, large and small. Tarpaulins may also be effectively used to cover exposed piles of aggregates. Wooden housing makes the most substantial covering for whole buildings, floors of buildings, small and moderate size bridges and similar work, and where the expense can be justified or compensated by re-use of the lumber, it is commonly preferred.

Straw or manure is commonly used around low forms and for foundations and low walls. Manure must not touch freshly placed concrete. Building paper, where it can be properly suported, is an efficient rotection against cold winds and is used over walks and floors, frequently carrying a covering of straw or manure.

Heating the Mixing Water

When it becomes necessary to impart heat to the concrete in order to have it come through the first 48 hours at a temperature of 50 degrees or more which is recommended, heating of the mixing water is usually resorted to as the cheapest and easiest method. An effort is often made to deposit the concrete at a temperature of 80 or 90 degrees. To do this the water may be used at the boiling point. It may be well to observe that since it is only the water in concrete that freezes, a reduction of the mixing water somewhat from the quantities ordinarily used will be found beneficial.

The three most common methods of heating mixing water for concrete are as follows:

(1) By exhausting live steam in the water tank or barrel, a method which is adaptable wherever live steam is available;

(2) By running the water through a coil of pipe supported over a fire, perhaps the easiest arrangement where there is running water but no live steam, and

(3) By the use of kettles or tanks supported over a fire—suitable where neither live steam or running water can be obtained.

Heating Aggregates

As the weather grows colder it is even more desirable to get the concrete into the forms at high temperature and heating of the aggregates—sand and pebbles or stone—is usually the next of the progressive methods employed. Contractors are in a habit of heating these materials to from 100 degrees to 150 degrees, striving to deposit the concrete at 90 degrees or as near thereto as possible.

Fireboxes, made of sections of discarded smokestack, iron pipe or boilers, serve as efficient heaters, the materials being banked around them and turned occasionally to insure reasonable uniformity to heating. Some concrete contractors prefer to construct their heaters of steel plates laid on concrete blocks or similar supports, the materials being heaped on the flat plates from which it is easier to remove them.

Steam jets are occasionally used being long perforated pipes which are thrust into the piles and used as a means of exhausting steam into the materials. This apparatus is not used as frequently as formerly, experience appearing to show that where steam is available it is more efficient and convenient to supply the heat through a grid of steam pipes, laid upon the floor where the aggregates are piled. In this case the pipes do not exhaust the steam into the pile, but simply supply heat in the same manner as an ordinary steam coil. Tarpaulins are frequently used to cover the pile and retain the heat.

Cement forms a relatively small portion of the bulk of a concrete mixture and, therefore, need not be heated. It should be stored where well protected from moisture and extreme cold. Never depend upon the heat generated by the action between cement and water. It is inconsiderable.

Some Other Suggestions

In extremely cold weather heat is frequently supplied at the mixer. This has been done by exhausting steam in the mixer drum and providing the latter with "flaps" if necessary to retain the heat. Recently very efficient kerosene torches have been introduced for the same purpose. Location of the mixer and other detils should be arranged so that concrete will be carried in the quickest possible time to the forms, and with the least exposure.

Immediately before filling each small portion of the form, the ice is removed if any be present. A steam hose is a great help in melting ice and warming form surfaces. In the absence of steam an ordinary blow torch may be used to heat the surface of steel forms.

Salamanders (coke stoves) and steam coils are the more commonly used pieces of apparatus for heating enclosures. A recently invented salamander having a water pan to provide moisture as well as heat in the enclosure is considered particularly efficient. Oil stoves and large lamps are quite frequently used on smaller work in rural districts where they are more easily accessible.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Repitition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

As The Editor Sees It

IN last week's issue of the GUIDE we commented on the scarcity of both common and skilled labor in the building trades and some of the means employed to overcome the difficulties of the situation. We have, on numerous former occasions, urged the removal of the seasonal stigma from the building industry. Now the scarcity of skilled labor is, no doubt, to a certain extent, influenced by the seasonal character of construction and means should be sought to remove this obstacle. The New York Building Congress, which has carried on various investigations pertinent to construction and the allied trades, recommended a program which would reduce the cost of building by adding more seasons to the industry. At the same time such a program would inevitably draw many men into the industry who now prefer to follow other trades not affected by weather conditions.

The New York Building Congress *Bulletin* states:

"While the congress feels fully aware of the fact that an entire cure for seasonal employment is impossible on account of weather conditions, opportunity for investment, emergency and the will of the owner and speculator, still the opinion is general that much can be done to adjust elements that affect peak demands and as a result decrease much of the unnecessary cost and loss to which the building industry is now subjected.

"With this understanding the following recommendations are made in hope that they will be suggestive to owners, investors, real estate brokers, architects, engineers, material manufacturers, contractors, labor and others who may be interested in reducing costs and eliminating unemployment periods:

"1. Establish a wider range of rental period dates.

"2. Regulate Government, State, city, religious and educational building construction so that it will come during the low period of employment wherever possible.

"3. Regulate the construction of new buildings and additions that are erected for owners' prearranged occupancy without regard for investment returns so that it will come during the low period of employment.

"4. Encourage beginning work on new construction March 1 instead of the customary date of May 1, thereby bringing its labor demand two months ahead of the demand peak, with a greater supply available.

"5. Plan maintenance and repair work so that it will come during the season for which there is a low demand for the labor involved, subject to emergency conditions that must be considered.

"6. Wherever possible, adapt the demand for 'inside' and 'outside' work to labor available."

PLAN TO INSTRUCT BOYS IN PLASTERING

Steps were taken yesterday by the Philadelphia Building Congress, at its weekly meeting, toward the establishment of a training system for young men in the plastering trade. D. Knickerbacker Boyd, president of the congress, appointed a committee consisting of James F. Pearce, James S. Meade, Harry C. Woods and D. K. Boyd, to confer with the Master Plasterers' Company and the local plasterers' union to arrange for a meeting with the Board of Education.

Contractors, union labor officials, architects, engineers, builders and material men have promised to push the plan suggested, which it is believed will be acceptable to the Board of Education.

Several contractors offered their services as instructors, and material dealers have offered to provide free materials. The contractors offered practical instruction by sending their best workmen to teach the boys.

The Philadelphia Building Congress agreed to undertake the publishing of such instruction literature as may be required.

September slate sales keep up the pace set by August,—running over ¾ of million, and are 2% above 1920, and 4% above 1921,—according to 61 producing companies reporting to the National Slate Association. 30 of the concerns

DRAWING MATERIALS

BLUE PRINTS

reporting show that September is the first month when the cumulative year's total of shipments in 1922 is 20% above 1921, and 10% above 1920.

Blackboard slate shipped in the first nine months of 1922 is only 10% behind the entire year's total of 1921, the largest blackboard slate year. As two of the largest producing blackboard quarries resumed operations in October after a 5 months' strike, there is no question but that 1922 will exceed 1921 by 15 to 25%. The increasing use of blackboard slate by industrial plants, railroad stations, newspaper offices, and other commercial places, in addition to the enormous educational building program now under construction, is responsible for this increased demand.

20% more roofing slate was shipped during September, 1922, than produced, but the stocks on hand would maintain that rate of consumption for several months. The added production of the two large quarries previously mentioned, will soon bring production up to the demand in most sizes, grades and colors. The demand for the stable blacks, greys, and weathering or sea green varieties is unusually good, as the public recognizes today more than ever the durability, importance and all-time cost of a roof and acknowledges slate's supremacy as an economic roofing material.

As expected, electrical slate September shipments were 25% higher than August, and are constantly increasing. Many large projects and buildings have reached the stage where electrical switch boards, panel boards, switch bases, etc., must be supplied.

Slate prices are holding firm. While fuel and car shortage embargoes materially delayed shipments during September and October, the acute situation is now somewhat relieved. Although considerable trouble in getting cars sufficient for shipments is still the rule, contractors and other slate users, appreciating the situation, are anticipating their slate needs and allowing more time between placement of their order and the time slate is required.

Meeting Being Called of All Branches of the Slate Industry

Manufacturers, producers, distributors, dealers, roofing and other contractors using slate are planning to gather in New York at the Commodore Hotel, January 25th and 26th, for the slate industry meetings to be held under the auspices of the National Slate Association. Many of the leading concerns in the industry will hold their own sales meetings with their representatives immediately before or after the dates of the sessions devoted to the industry problems. Roofing contractors and other users of slate all over the country have responded well to the need for a co-operative promotion of the use of slate and the betterment of the conditions and relations within the industry, which Secretary Hoover urged the progressive concerns of the Industry to undertake at the first meetings last year. The results of the first nine months' effort have more than justified the Secretary's judgment.

WEATHERPROOF YOUR HOUSE—PREVENT UNNECESSARY LOSS OF HEAT—SAVE COAL

(From the Division of Building and Housing, U. S. Department of Commerce)

The saving of fuel is not seriously considered in the building of most houses. Many are shabbily built, and permit too much cold air to enter the house. Only a few years ago fuel was cheap and few bothered about saving it. While it is true that most attention should be given to the proper building of new houses, much can be done to prevent the loss of heat in poorly built and run-down houses. To save heat now not only helps to meet the present coal shortage, but it will teach those who plan to build new houses the value of weatherproofing and good construction. Our own comfort and that of our neighbors demands that we obtain the most heat from our coal without waste and that we try to reduce our requirements as much as possible.

All houses should be well ventilated, but this does not mean that unregulated drafts of cold air should sweep through the house at all times. It should also be remembered that in cold weather the warm air is continually escaping and as it passes through holes and cracks in the walls it is at once replaced by the cold out-of-doors air.

Cracks around the windows and doors, broken window panes, and unprotected heating pipes indicate that fuel is being wasted. If one family wastes fuel during the coal shortage, another may suffer for there is not enough coal to supply all with their usual amounts this winter.

The first duty of every one is to see what savings can be effected. Many suggestions appear from time to time as to how to save coal; some are excellent and can be followed easily and at little expense; while others may involve an expenditure which cannot be met. However, broken window panes should be replaced and the worst cracks around windows and doors closed up wherever possible, for this cost is less than the cost of the extra coal that will otherwise be burned. Inability to pay for expensive improvements is no excuse for not making those which can be paid for out of the saving of fuel within the next year or two.

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls

For Preserving Brick-Stone-Stucco-Concrete

THE TRUSCON LABORATORIES —

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

(Continued from page 744)

How much coal can be saved? If every family would save one ton of coal it would mean a saving of millions of dollars. During the present coal shortage the coal thus saved might be distributed among those who otherwise would be unable to obtain sufficient fuel, and perhaps keep many from suffering.

Millions of tons of coal can be saved this winter by the making of slight repairs on houses and the exercising of a little more care in burning coal.

Inspect your house. Some home owners have a reliable repair man look over their houses in the same way that they have the dentist look over their teeth. The owner can then decide what repairs can be undertaken. Much of the work he can do himself. The work he is able to pay for now can be done immediately.

Where and what to look for. In making an inspection the owner should examine the windows, doors, transoms and floors. He should also inspect the attic and the basement, examine the damper in the fireplace, and cracks under the baseboards. It might be well for him to start with the windows:

Windows. Much cold air comes in around the windows or through them. Windows are often poorly fitted into the openings. Occasionally it is possible to see between the brick wall and the window casing. Window sash are rarely fitted snugly, and cold air enters freely around the sash. It is not uncommon to find a wide crack between the upper and lower sash. Such cracks can sometimes be closed by means of the sash lock. The use of weatherstripping will take

care of most of the cracks around a window, and the saving of coal will be well worth while in a large number of houses.

It is well to go over all windows to see that putty is in place around the panes. A poor quality of putty is used in some of our houses and where it has fallen off air enters around the glass.

That broken window pane in the basement should be replaced as promptly as if it were in the living room. Broken window panes in a basement where heating and plumbing pipes are exposed waste fuel. The attic windows should also be examined.

In cold climates double or storm doors are very good to keep the house from getting cold. The air space between the two windows prevents the rapid passing of heat to the outside. Storm windows might be put over the windows on the side of the house facing the prevailing wind, even though they could not be afforded for all windows.

Doors. Doors are often poorly fitted and air passes freely both above and below them. The crack below the door is often so large that cold air sweeps across the floor, keeping the room cold. A strip of cloth or felt nailed to the floor or to the door will keep out much of the cold. Hinges are not always well fitted into the door and frame, allowing much cold air to enter the house. This can be remedied by resetting the hinges. Transoms over doors should be examined, for they are not always snug fitting.

Storm doors involve some expense, but in many cases it is profitable to install one on the windward side of the house. It will prevent the inrush of cold air. The storm door as well as the storm window is used chiefly in the colder climate.

Floors and baseboards. While double floors are becoming more common there are many houses in which a single floor is nailed direct to the joists. If tongue and groove flooring is used there is no draft, but there are floors with cracks between the boards. If there is no basement under this part of the house cold air will enter. Even though the floor be good, it does not give as much protection as a double floor.

In houses where there is no firestopping between the studs of the wall, cold air can pass freely from the attic to the basement. In such houses, if the plaster goes down only a little below the top of the baseboard, much air enters the rooms under the baseboards if they do not fit closely. Such cracks should be closed.

Basements. In some houses the warm air can pass from the basement upward betwen the studs. If such is the case it is advisable to close up the openings between the joists with old brick, or some other material. Basement doors and windows should be examined and made as tight as those in the rest of the house. Cold air entering the basement cools the heating pipes and furnace and the floor above.

The covering of the furnace and of steam and hot water heating pipes, especially in the basement, is advisable. Although insulation may be expensive, it is well to consider the cost of fuel and saving that can be effected.

Attics. Attics are usually cold and give plenty of chance for cold air to enter the house and for warm air to escape. Sometimes shingles are nailed direct to cleats and the out-door air enters between the cleats at the ends. Again free passage-ways for air in the walls, between the attic and the basement, keep this cold air in circulation. If the openings between the cleat ends are closed cold air may be kept out. The windows in the attic should receive as much attention as those in other parts of the house. Dead air in an attic keeps the lower stories warmer, while the direct opposite is the case with currents of air. The currents must be avoided and this is accomplished if the house is properly firestopped.

Personal attention. There are things that can be done to keep the house comfortable that do not cost money, but require some time and attention.

The locking of windows when closed, the drawing down of shades, the turning off of heat in an unused room or at night when windows are open, periodical care of heating equipment, all require a little time and thought, but will save heat. This means the saving of fuel for the nation, and lessened household expense. Special attention should be given to ventilation.

Thermometers are better gauges of heat than are the various members of a family, each with his own idea of warmth. Sixty-eight to seventy degrees is the normal healthful temperature for rooms in which people live.

Opening windows at night. To throw bed room windows wide open on cold nights and leave the heat turned on results in much waste of coal. It is often best to turn off the heat. Good ventilation is possible without large openings. In the rest of the house it often is advisable not only to close windows, but also blinds and shades. Merely pulling down shades makes a material difference in the temperature of a room.

Chimneys, stove pipes, fireplaces. Chimneys and stove pipes should be examined and cleaned out whenever necessary. Chimneys and stove pipes are intended to serve as flues and the clogging of them affects the proper burning of the fuel. When fireplaces and stoves are not in use the dampers should be closed.

Care of furnace or stoves. The same care should be given to the heating plant as to one's automobile. If the furnace or stove is out of order fuel will be wasted just as gasoline is wasted when the automobile is out of repair. If cracks are found in the furnace it needs prompt attention. A cracked or broken grate should be repaired or replaced.

Advice as to the most efficient and economical use of fuel in various types of heating plants can be obtained in many cases from the makers of the plants.

There are few householders so situated that they can not save money by attention to weatherproofing and stopping heat losses. At the same time, they will be doing a good turn for their neighbors by saving fuel.

WILL CONTRACTORS BECOME OBSOLETE?

How will the directory of 1950 define the word Contractor?

Will the definition likely be:

CONTRACTOR: 1. One who enters into a contract with another person or corporation.

2. (OBSOLETE) One who agreed to do a certain piece of work, usually manual labor, for a sum agreed upon at the time of entering into the agreement. Sometimes this sum was a fixed amount, but more usually it was based upon a specified rate per unit of measurement. During the first quarter of the twentieth century, such contractors were found in every section of the United States. Shortly after the World War, this method of doing business was superseded by a system known as "Force Account," and the contractor is now an extinct species. (Universal Dictionary, edition of 1950.)

If the contractors of the United States do not wake up and start some sort of a publicity campaign, their grandchildren will read some such definition as this in the dictionaries of their generation. In fact, if something isn't done soon, we may all read it in the next issue of Webster. The extent to which public officials are entering the construction field is causing the contractor a maximum of worry with a minimum of work, and private enterprise reveals signs of following the lead of our public servants.

In the good old days, the kind we love to talk about, though we would dislike having to live in them, there were no contractors, in fact, no specialists of any kind. The barber attended to healing the sick as a side line—that was how he acquired his striped pole, and his penchant for combining blood letting with your morning shave. The pastor of the village church taught school in his spare time. The attorney practiced law when it did not interfere with trade at his general store. And everyone "pitched in" when there was a road to be built, or a new building to be erected. Old barn raisings were events.

Today we tell the barber to stick to his shop. Specially trained physicians minister to us when we are ill. The pastor devotes all his time to his spiritual work, and the storekeeper remains in his store, while licensed attorneys dispute the fine points of the law as long as their clients remain solvent. Barn raising has in large measure gone the way of the apple jack and the peach brandy which were so prominent a part of the festivities in grandfather's time. The neighbors leave building construction to men who have specialized in that field.

But the contractor, having reached a point where he was regarded as indispensable, is now being eliminated. Not the big fellows, of course. But the big business man of today was the little chap of a few years ago, and where do you find the small contractor in these times?

Young Men Deprived of Opportunities

What chance have our ambitious young men, fresh from schools, universities or practical training—boys just as energetic and virile as their fathers a generation ago—what chance have they to carve their way to success in the contracting field?

There is work to be done in their cities, in their counties, their states. But do they have an opportunity to bid on some portion of it, to establish themselves in business in a small way, and to take pride in having done their bit to improve their community? They do not.

Some states provide that all public work shall be let by contract to the "lowest responsible bidder." It is practically impossible to persuade the average taxpayer that the man who submits the lowest figure is not just as responsible as the one whose bid is a little higher, but even that is not the worst feature of the matter. Before the war, few state and county officials tried to evade the plain provisions of the act. Today, it is getting quite common to call for bids, reject them all, and then do the work by "Force Account."

One state has a law providing that all counties having a population in excess of 50,000 shall call for bids on all public works. As there is only one county in this state which comes under the provisions of the act, all other sections of the commonwealth may do as they please. And they do.

In either case, what chance does the boy have to establish himself in business? In one instance, after he has spent time and money in preparing a reasonable bid, he sees his proposal filed away in a pigeon hole. In the other, he does not even get a chance to bid. Some city, state or county official, totally ignorant of the difficulties of contracting, but supremely confident of his ability to do the work more cheaply than can any one else on earth, decides to do it by "Force Account." The boy gets the choice of handling a pick and shovel, or of going without work altogether.

A large educational institution in a Western State recently enlarged by constructing a big building. Graduates of the college, ambitious to start their business careers on the campus of their alma mater, would have liked to submit bids on portions of the work. Were they allowed to do so? Not a bit of it. All work was handled by day labor, an employe of the college acting as superintendent of construction. He did a good job, but the boys got their business education at the end of a long-handled shovel.

Every county in the United States has many small jobs which should be let by contract. They are too small to interest the big fellow, but the little chap needs them and needs them badly.

Big Contractors Not Exempt.

Even big contractors are being hit by the menace. Observe the municipal paving plants that are springing up all over the country, representing another encroachment by public officials upon what should be wholly a matter of private enterprise. Grant that these officials can do the work as cheaply and as efficiently as experienced contractors. They can't—but grant it for the sake of argument. What then? Will they build up efficient organizations and maintain them permanently? Or will Bill Jones be retained as foreman only as long as the Republicans remain in power, to be replaced by the inexperienced Mike Collins when the Democrats win an election? And will either Bill or Mike spend much of his time studying the science of paving, when he knows that the next election may throw him out of a job? Naturally he will devote most of his time to electioneering. The plant can go hang!

This condition is partly the fault of the contractor himself. He greeted the "cost plus" type of contract as an ideal system, one that would eliminate his worries while giving him a fair profit. He failed to see that it was necessary to educate the public to the fact that contracting is a highly specialized profession, and that the "plus" covered such intangible, but valuable, items as organizing ability, overhead, and a multitude of similar expenses. The public did not understand. It saw that it was paying the full cost of the work with an added profit to the contractor. It thought, not unnaturally, that it could do the work itself at cost, and save the "plus."

But can it? It has not the training to organize properly, to buy in the cheapest markets, to carry on the work in such a manner that there shall be no delay, nor to handle the labor problem without friction. All the public sees is the cost of the work, not realizing that the cost of work under public direction is greater than the bid a contractor would have made, or greater than the "cost plus" price of an experienced builder. Much publicity—call it propaganda if you will—will be required to teach the public that it takes trained men to build a highway, install a sewage system, or erect a building. We have such trained men today. Will we have them in the next generation?

Must Correct False Notion

We all know, of course, why some public officials are refusing to give work to contractors. Contractors are such a bunch of bad eggs. Think of their record during the War! They actually took contracts for building the cantonments on an iniquitous "cost plus" basis, and think of the cost of those army camps! That labor and materials soared in price from day to day during the entire period of construction has nothing to do with the case. Had the contractors been honest, patriotic citizens, they would have built the barracks at the same cost as was in force in 1916. To be sure, no contractor has been convicted, or even indicted for graft or for profiteering in this connection, but that is all due to the failure of the attorneys to prosecute, or of the courts to take drastic action.

Rot? Certainly, but does the public know that? Or know that the charge is just a smoke screen thrown up to give a lot of deserving political retainers a chance to get on the payroll? No, because the public has no chance to know it. Its reading conveys the other idea, from the little weekly published in the county seat and kept alive by printing the legal notices passed out by the powers that be to the Congressional Record with its latest attack on the profiteers. Is it any wonder the public believes as it does when it has no opportunity to learn the other side of the question?

It is time the contractor presented that other side of the case, instead of sitting back, secure in the conviction that "Truth crushed to earth will rise again." Undoubtedly it will; but it won't hurt to give it a helping hand. It may otherwise not rise until too late to do our boys any good.—*American Contractor.*

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."

As The Editor Sees It

SUPPLY and demand still regulate prices of everything from food to labor, hence the large wages being paid plasterers at the present time. The ideal state, of course, is an honest day's pay for an honest day's work, but we have not yet reached this state of idealism. However, there is a constant effort toward fair dealing on the part both of employers and employes, which should eventually bring about much more peaceful and equitable conditions in the field of industry. Strikes, heretofore the only weapon which labor has considered effective to wield against employers, will certainly be lessened, and perhaps, done away with, in the striving for co-operation and understanding between employer and employee.

The most notable example along these lines which has come to our attention recently is the establishing of a National Council on Industrial Relations for the Electrical Construction Industry. The Committee consists of five members appointed by the National Association of Electrical Contractors and Dealers and five members appointed by the International Brotherhood of Electrical Workers.

The principles laid down by the committee are:

"Facilities of the electrical industry for service to the public will be developed and enhanced by recognition that the overlapping of the functions of the various groups in the industry is wasteful and should be eliminated.

"Close contact and mutually sympathetic interest between employe and employer will develop a better working system, which will tend constantly to stimulate production while improving the relationship between employe employer and the community.

"Strikes and lockouts are detrimental to the interests, alike of employe, employer and the public, and should be avoided.

"Agreements or understandings which are designed to obstruct directly or indirectly the free development of trade, or to secure to special groups special privileges and advantages, are subversive of the public interest and cancel the doctrine of equality of rights and opportunity, and should be condemned.

"The public interest is conserved, hazard to life and property is reduced, and standards of work are improved by fixing an adequate minimum of qualifications in knowledge and experience as a requirement precedent to the right of an individual to engage in the electrical construction industry, and by the rigid inspection of electrical work, old and new.

"Public welfare, as well as the interests of the trade, demands that electrical work be done by the electrical industry.

"Co-operation between employee and employer acquires constructive power, as both employes and employers become more completely organized.

"The right of employes and employers in local groups to establish local wage scales and local working rules is recognized, and nothing herein is to be construed as infringing that right."

So far the council's efforts have met with unqualified success and many strikes, or rather, threatened strikes, have been settled or called off. When such a plan is put to work in other industries, the losses imposed upon employer, employe and the public by strikes will be eliminated.

Mr. G. D. Bury, secretary of the Electrical Contractors' Association of Cleveland, has declared:

"The Council on Industrial Relations in the Electrical Construction Industry has been of the greatest benefit to all concerned. It handled a dispute over wages here in Cleveland that might have tied up the industry at a time when we could ill afford any losses. That we have worked under the decision which they handed down and have had no stoppage of work because of any of the factors which they dealt with is good enough evidence that the principle of the council is sound. Personally, I believe that this method of settlement is the most logical one that can be found.

"To call an arbitration board composed of three groups, the public, the employers in the dispute and the work-

BLUE PRINTS

ers is nearly always deemed unfair by labor. They claim that the representatives of the public on any such board are always selected from those people who are themselves employers of labor in other lines or are interested in such employment. Follow the history of decisions handed down by such groups and you will find that there has been more trouble in enforcing the decision than there would have been if the employers and the employes had gone to bat in the first place."

Joseph G. Shryock, C. E., M. C. E., Associate Member A. S. C. E., has just been appointed Chief Engineer of the Belmont Iron Works, Designers, Manufacturers and Exporters of structural steel with Plants at Philadelphia and Eddystone, Penna.

After graduating in Civil Engineering at the Pennsylvania Military College in 1900, he became associated with the Bridge and Construction Department of the Pencoyd plant of the American Bridge Co.

In 1903 he accepted a position in the Engineering Department of the Virginia Bridge and Iron Works at Roanoke, Va., remaining there until 1904 when he returned to Philadelphia to accept a position with the Belmont Iron Works. In 1906 he was appointed Designing Engineer, which position he held until his present appointment.

He joined the American Society of Civil Engineers in 1901, and in 1921 was awarded the honorary degree of Master of Civil Engineering by the Pennsylvania Military College for his professional work in connection with large industrial plants built by the Belmont Iron Works during the great war.

THE HOME BUYER AND HIS PROBLEMS

By JOHN M. GRIES, *Chief, Division of Building and Housing*

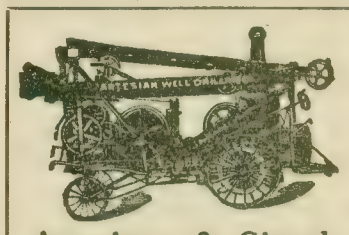
(*Address before New York State Association of Real Estate Boards, Albany, N. Y., October* 20, 1922.)

Surveying the country from coast to coast and from the Lakes to the Gulf, we find housing conditions spotted. Here and there are dying villages and static cities in which there are many more houses than jobs. The leaders in the upbuilding of these towns or cities failed to forecast clearly their future. On the other hand we find cities in which the planning was inadequate, the forecast was faulty, and the builders were unable to meet the demand for new houses.

As long as two or more families must live in one small apartment, as long as people must live in unsanitary houses, there is a housing shortage which should be remedied. Some one may say that there is no housing shortage in his city. This may be true. It may also be true that the man who says this is the agent for several 10, 12, and 14-room houses. He may say "just look at the number of houses that are vacant." There may be a surplus of large houses, but how about the five and six-room houses? If the demand for these houses cannot be supplied, there is a housing shortage notwithstanding the fact that any number of large houses may be vacant. If the people in need of houses cannot pay the rent asked for the large houses, they are of little use. Whether or not you believe there is a housing shortage depends somewhat upon the point of view. Suppose you visited nearly all of your local stores, being badly in need of a new hat. Suppose you were told by each and every dealer, "We haven't your size, but we have several hundred brown derbies, size 7 7/8." Now the dealers might not admit a hat shortage, but most of us would be convinced that there was a shortage.

In some cities it is next to impossible to overcome the shortage at present. The cost of building is so high and the income of those who should be in the market for houses so reduced, that little is being done. If there are too many houses they will not rent for enough to make ownership a paying investment. If there are not enough houses, rents will be high and the people dissatisfied. The housing shortage will not be relieved unless the money invested will afford a satisfactory return. Occasionally when conditions are abnormal or unsatisfactory some kind of a simulus is provided, or restrictive measures enacted. While some measures prove helpful, artificial restrictions very frequently prevent the fulfillment of the very things which legislation is intended to provide.

The Department of Commerce, under Mr. Hoover's leadership, is actively interested in housing in the broad sense; interested in providing better homes under private initiative and management, and is co-operating with all groups in bringing about improvements. The Department appreciates the co-operation and assistance received during the past year from the various real estate boards, and is ready to work with you in your efforts to improve housing conditions.



The real estate dealer fits families into homes. You have much to do with the happiness and contentment of families. There is no greater work than to aid in making better homes. This is your work and as a result of your work you must earn enough money to make a living. The good you are able to do is so great that there ought to be a real joy besides that of money-making.

The typical-manufacturer is pleased

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls

For Preserving Brick-Stone-Stucco-Concrete

THE TRUSCON LABORATORIES —

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

Bungalow, Trenton, N. J. Architect, William Klemann, First National Bank Building, Trenton. Owner, H. A. Stutts, Plainsboro, N. J. Hollow tile and stucco, 1½ stories, 30x60 feet, slate roof, hardwood floors, hot water heat, electric light. Owner will take bids.

New Jersey Contracts Awarded

School, Egg Harbor ,N. J. Architect, Frank F. Sanders, 39 South Seventeenth street, Philadelphia. Owners, Board of Education, Egg Harbor, N. J. Contract awarded to Jacob Albert & Carl Weiler, Egg Harbor, N. J.

Residences (2), Liberty street, Trenton, N. J., $6,000. Architect, private plans. Owner, Michael Kelly, care of builder. Brick, 2½ stories, 14x46 feet, slate roof, pine floors. Contract awarded to Louis Mangold, 330 Bert avenue, Trenton.

Store and Residence, Brunswick avenue, Trenton, N. J., $7,000. Architect, private plans. Owners, Trenton Trust Co., State and Chancery streets, Trenton. Brick, 2½ stories, 36x63 feet, slate roof, hardwood floors, steam heating, electric lighting. Contract awarded to General Cont. & Const. Co., 117 Emory street, Trenton, N. J.

Miscellaneous Construction News

Store, Van Dever and Pine streets, Wilmington, Del. Architect, John A. McKibbin, Industrial Trust Buuilding, Wilmington, Del. Owner, Daniel Levine, 529 Van Dever street, Wilmington. Brick, 1 story, 30x48 feet, rubberoid roof, hardwood floors, hot water heat, electric light, plate glass, metal ceilings, ornamental iron work. Owner ready for general and sub-bids.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Many a man would do a better job if he didn't know about putty.—**Ex.**

with repeat orders. The average retail dealers' success depends upon repeated returns of his customers. Only stores with a transient trade dare skin their customers alive. A business dependent upon repeated sales to the same customer is forced to maintain a high ethical standard. However, many of your customers buy homes or property but once or twice. As a rule they are neither good judges of location, nor of construction or values. They do not know what to look for. Many are ignorant of the most common trade practices, ethics and law. The fly-by-night real estate man sells largely to the ignorant and unsuspecting, and his action can implant in the public mind a distrust of all real estate men.

We are your customers. What do we want? What have you to offer? We become skilled in doing the things we do often; we may become skilled buyers if we buy often; but first performances as a rule are crude. Most people buy but one or two houses in the course of a lifetime. Because of your experience you are in a strategic position to be of real service. What service do you render to the home buyers? If the customer is stung, he blames you, but if you aid him to acquire a bargain he credits it to his own business sagacity.

Is salesmanship highly developed in the real estate field? Does it tend to educate the customer? The milliners have the real estate men badly beaten. They never try to put two women's heads into one hat the way you put two families into one apartment. On the contrary they succeed in putting one woman's head into seven hats and you put seven women's heads into one flat, and your action may in part be due to the fact that the milliner sells the seven hats.

Some retail stores will not sell over their counters merchandise below a certain standard of quality. Is it the real estate dealer's function to sell anything offered for sale? Or is he at liberty to refuse to negotiate the sale of a Jerry built house? As long as the real estate dealer will sell anything for a commission, is it not impossible for him to take much interest in educating the public along the lines of the quality of the house? Will he not follow the doctrine—let the buyer beware?

We hear a great deal nowadays about vocational education. Universities and schools of various kinds are offering courses of special training to educate men and women in practically any trade or profession they may choose to follow. And if we examine the advertising pages of the daily papers and the magazines, we find some conspicuous examples of another phase of modern education—that of manufacturers educating their customers. The automobile manufacturers have done a great deal to make us think we need an automobile, and to inform us all about such matters as tires and gasoline and oils. In the clothing field there is no lack of education in the season's best styles. The food value of manufactured foodstuffs is told us repeatedly, and the advocates of an article of food frequently give sound information on the essentials of a balanced diet and kindred subjects. And just think of the educational work being done by those who produce labor-saving equipment for the home. They tell us how to get the article, where to get it, how to use it, and how to take care of it.

At such a period, what do we find in the way of education for those who wish to buy a home? To be sure, a few special periodicals devoted to the subject of housing are doing good work in a limited way, but they are concerned largely with the artistic side of a home. Nowhere do we find a conscious effort made to provide the balanced information people need in the selection of a home.

But, you may say, education is a matter of months or years of constant learning, and is applied to some work or habit you expect to use all the rest of your life. How then can you expect us to educate a man in something he does only once or twice in his life—like the buying of a home?

Now buying a home is something like taking a trip abroad. Many of those who take it do it only once or twice in their lives. But if there is any point on which the tourist is uninformed when he starts, it is because it slipped the ticket agent's mind. He is told which boat is best to take, which hotels will give the most comfortable accommodations, what points of interest to look for and how to reach them.

Do you real estate men do as much for your customers? Do you leave pamphlets in hotel lobbies, or send copies to prospective home-buyers, educating them along the lines they are going to need? Do you tell them how to recognize a section where values are bound to remain good for years to come? How to tell a well constructed house when they see it? Do you teach them what they have a right to expect in the way of protected property rights?

Teach people what to demand in the home they buy. Teach them what are the essentials of comfort, convenience and beauty, and what are the unessentials which can be added later, as the debt on the house diminishes. Architects and builders have done a good work in educating the public away from the ornate trim which decorated the gable and cornice and porch of the last generation. Now teach them to know a house that is a worth-while investment.

You know and I know that real estate dealers render exceptional service to those who buy homes. They prevent many mistakes. They do not take all the traffic will bear. The very fact that the strong man has come forward, standing for public service, is the thing that is bring about public confidence in you. If you retain that confidence you must eliminate, insofar as possible, those who do not follow the highest standards.

You do more than fit families into homes. You have much to do with the kind of cities we live in. You take interest in the protection of the homes through zoning ordinances and wise planning of cities to prevent waste. In fact the leaders are active in all that relates to better housing.

The prospective buyer of the home as a rule has few dependable standards by which he can judge the value of a piece of property. He frequently knows little about sound methods of financing his purchase. Some feel that they need impartial sound advice on such matters as:

1. *Value of the House.* State of repair, quality of construction, foundations, roof, heating and plumbing equipment.

2. *Value of the Lot.* Location, improvements, streets, paving, water mains, gas and electric facilities.

3. *Financing—Trustworthy Lenders.* Advisability of amortizing loans and avoidance of high financial charges.

4. *Expenses of Home Ownership.* Accessories, improvements, repairs, maintenance, depreciation and obsolescence.

Few laymen appreciate the value of the location, quality of materials and workmanship; convenient arrangement of the kitchen; the worth of a dry cellar and the significance of a diagonal crack in the plaster. If it is your job you have much work ahead of you, and it will do much towards obtaining better housing conditions. Should the prospective purchaser be enlightened and, if so, by whom? Or should they be sold anything whatsoever on the theory "let the buyer beware?"

For years we have been saying *save, save, save.* Such admonition has little effect unless back of it there is a clearly defined purpose. We do our best only when we are saving for something definite. The object must be something worth while; it must have a strong appeal and it must be something possible of attainment.

A home of your own is worth while, it has an exceptionally strong appeal, but to many under certain conditions it seems impossible.

It is the duty of all interested in better housing to see that owning a good home and living in better houses is made possible. To encourage home ownership is laudable but to deliberately sell a man a house which you know he cannot pay for is criminal. Your work is to help make home ownership possible, and to

render the service that a good broker should render to his client.

Your aid is needed along many lines. You can help in securing better building codes, plumbing codes, housing laws and proper zoning ordinances. You can aid in creating an American architecture for small houses—help to change the design of our small houses from that of a cross between a dog kennel and a barn to something more attractive.

Judging from the annual reports of many local boards covering "What Has Your Board Done For Its City and Community That Merits Consideration?" the record is a creditable one. Many members have given aid to the establishment and development of building and loan associations which loan money on real estate at reasonable rates. Some boards have investigated charges of fraud made against those who sold real estate, and made it more difficult for the crook to operate. They have also enlightened some buyers who thought they had grievances; they have met the newcomers into the city and aided them in obtaining suitable locations. Your appraisal committees have done very good work. You have interested yourselves in better homes, in demonstrations to show what a home should be, and in many efforts tending to educate the public towards higher housing standards.

The leaders in the real estate field are moving in the direction of higher ethical standards and there is a distinct trend toward rendering greater public service. Within the next few years let us hope that the standards of the laggards will be raised. Then more men will be proud to say "I am a real estate man."

RESTORE CONFIDENCE OF THE EMPLOYEE

Efficiency Only Through Loyalty and Pride of Organization

By Chas. *H.* McAllister, *General Manager, The Lake Erie Construction Co., Cleveland*

In presenting the aims of the Associated General Contractors to the general public, our organization has made gratifying progress, particularly with engineers and architects, and we in the Cleveland District are encouraged by the co-operation we are receiving from them in our efforts to arrive at a better understanding of our mutual problems.

Before us and demanding immediate attention, however, is a weighty problem which must be met and solved before we can carry out that program which we have set for ourselves, which challenges our ability to fulfill the claims of skill and integrity which we are making.

This problem is to sell our organization and all it stands for to our workers.

For nearly eight years the conditions existing have caused an instability in the construction industry, which has resulted in a change in the relationship between employer and employee and has produced an apparent loss of confidence, which formerly prevailed and which must be restored before the construction industry can be again placed where it should be.

Efficiency Through Freedom

Unhampered, the American workman produces efficiently, and should receive remuneration which permits of his right living, maintenance of self respect and freedom of thought and action. It would be folly on the part of the employer to contemplate any action tending to restrain the worker's right to affiliate himself with responsible trade organizations which have for their aims the betterment of working conditions. It is right, however, that the Associated General Contractors of America should present to the worker in the construction industry, frankly and clearly, its aims as an organization, particularly its ambition to place the industry on a high plane, and leave to his fairmindedness the question of how far he will co-operate in establishing the industry on that plane.

Our American institutions have fostered the spirit of accomplishment in our people. In times past and through the individual expression of ambition, we have prospered. Hampering this spirit through control of production will surely suppress individualism, and will further tend to utterly destroy the relationship between employer and employee which has existed to the great advantage of both.

What Has Happened

In attempting to carry out our present construction program, we daily come into contact with the same condition in industries linked with ours, and also in those transporting our supplies and material. A former railroad official (now in construction industry) called the writer's attention to the spirit of apathy existing in the railroad ranks, in marked contrast to the loyalty and pride of organizations of ten or fifteen years ago.

There can be no prosperity without production. The worker must know that low production with large profits does not make for the prosperity of either capital or labor. In our American industry the successful method is rapid and economical production with a small margin of profit. With the worker there must be less idleness and more production.

Public works and railroad contractors have been able in times past to maintain a regular organization, and could do this becuse of the loyalty and co-operation of their employees. In selling their services to their clients the knowledge of this loyalty and co-operation enabled the contractor to enter into an agreement which he knew he could carry out satisfactorily.

Overspecialization a Detriment

Overspecialization of workers has lately hampered the efforts of these contractors; in consequence there has been no benefit to the employer or to the employee. A rapid turnover of labor because of restlessness of employees has added a very heavy expense to construction, on account of the necessity for a constant reorganization of forces due to this unsteadiness on the part of the worker. It would be well for our members to give more of their attention to this evil, and through co-operation with the Association to seek the elimination of this trouble. The worker must also realize that any effort of the employer to stimulate business through economical production is largely to his advantage, in that it will lessen the amount of idleness which we now have in the building industry.—*The Constructor.*

THE TROUBLESOME PROBLEM OF EXTRA WORK—HOW CONDUCTED AND HOW PAID FOR

By the Standardization Committee, K. H. Pratt, *Chairman, General Contractors' Association of Cleveland*

It has been common experience that the matter of charges and credits for additions to or omissions from plans and specifications for a building project are apt to be a source of controversy between the contractor and owner. Unfortunately, it is very seldom the case that a building is put up without some alterations or modification of the plans, which involve a change in the contract price or the work, and there has been no standard practice in adjusting these differences, so far as we can determine. Therefore, your Committee has gone into the problem of trying to determine fair and equitable relations between contractor and owner where such changes are involved, and has formulated certain very definite recommendations.

Alterations or deviations from the original plans and spectications are a source of expense to the contractor, whether the change be in the nature of an omission or in the nature of an addition. All such changes are apt to interfere with the progress of the work, delay the completion of the work as a whole, cause the contractor additional expense on other work in progress on the job which is affected by the changes, and make demands not only on the contractor's field organization but upon his main office organization out of proportion to the amount of work involved. It is evident that there should be a charge to the owner for the services

so rendered, regardless of whether the work is an addition or omission.

Recommendations

This leads to our first set of recommendations:

a. That all charges for additional work take into account the contractor's overhead in addition to the actual cost of the work and the contractor's profit.

b. That all omissions take the same items into acount, and, to accompish this end, we recommend that allowances for omissions be based upon the actual estimated cost of the work without any allowances for the contractor's estimated profit on the operation involved—it being our thought that such estimated profit should be retained by the contractor to compensate him for the additional expense involved in deviating from the original plans.

c. Accurate written records should be kept and all transactions relative to changes should be confirmed in writing between the contractor and owner.

Interpreting Plans and Specifications

Where work is considered by the contractor as additional to his contract price, such additional work may arise from a disagreement as to the interpretation of the plans and specifications, or it may be an addition to the plans acknowledged by the owner.

Where work is considered by the contractor as additional to his contract price, such additional work may arise from a disagreement as to the interpretation of the plans and specifications, or it may be an addition to the plans acknowledged by the owner.

We recommend:

1. That all contractors prohibit their field organization from proceeding with any additional work to the contract, whether acknowledged or not by the owner, without specific instructions from the contractor's main office or his authorized representative.

2. Where the contractor proceeds with work in dispute as to whether or not it is extra, it should be a matter of written record from the contractor to the owner as to the contentions involved and as to the basis on which the work is being done.

3. Where there is no dispute involved, the work should only be done on the written authorization of the owner or his agent.

4. An accurate record of all labor and material used in connection with extra work should be kept on a separate extra work report sheet, with prpvisions made thereon for the signature of the duty authorized agent of the owner directing the work to be done, and charged to the owner.

Lump Sum of Time and Material

Where work is performed additional to the contract, it may be handled in two ways. Either on a basis of an agreed lump sum charge or on a basis of time and material plus a percentage for contractor's profit.

We highly recommend that all work which can be intelligently priced and handled on a lump sum basis be so handled, and that the lump sum be agreed upon prior to the execution of the work, with proper acknowledgement of the work and amount involved.

Where it is impossible either through the nature of the work on the time element to definitely arrive at a lump sum price, we recommend that the work be performed on a time and material basis plus percentage for contractor's profit.

Charges for Extra Work

In the absence of any denite agreement in the contract, we recommend that charges for extra work performed on a time and material basis be billed to the owner in accordance with the following:

General Items of Cost

The general contractor shall be reimbursed in the manner hereinafter described for such of the actual expenditures in the performance of the work as are included in the following items:

a. Wages of workmen, material supplies, tools and appliances (as distinguished from machinery and equipment listed hereinafter), and cartage and freight require for the completion of the work in question, either as shown by the revised plans and specifications, or by written instruction, and for the installing equipping, operating and dismantling of temporary works, plant, machinery and equipment, sheds, offices, commissary and hospital.

b. Sub-contractors placed by owner or general contractor for material or labor or both.

c. Rental, or its equivalent, beginning with shipment and concluding with arrival at return shipping point, at the rates set forth in attached schedule, for the general contractor's machinery and equipment, and rental actually paid by the contractor for other machinery and equipment, or parts thereof, as used in the prosecution of the work, cost of loading, unloading, shipping charges to and from the job, and ordinary repairs and replacements during use and shipment for all machinery and equipment. Rental n machinery and equipment in place at average rental and maintenance charge per schedule assigned by Associated General Contractors or general or main contract.

d. Premiums for bonds and fire insurance, fee of Building Trades Employers' Association, expenditures for telegraph and telephone service, expressage, postage, field office supplies, permits, deposits, royalties, and other similar items incidental to the execution of the contract.

e. Salaries of superintendents, foremen, engineers, timekeepers, clerks, expeditors, watchmen, waterboys, and all other employees in the field office of the general contractor to be pro-rated over the total number of workmen's hours daily and the proper proportion of the superintendent's, timekeeper's, watchmen's, waterboy's, etc., time charged to each item of extra work. If any of these men are giving an overdue amount of their time to any or all items of extra work then their exact time given to the extra work is to be charged.

f. Salary allowances proportionate with time actually applied to this work for employees dividing their time between this and other work, transportation and incidental traveling charges to and from the work for the necessary field forces required in the economical and successful prosecution of the work in the procuring of labor, and in expediting production and transportation of materials and equipment, and for other employees or officials of the general contractor actually incurred in connection with this work.

g. Compensation, public liability and contingent insurance on all wages and salaries. We recommend a charge of seven per cent. of the pay-roll to cover these items, together with the uncovered risk.

h. An allowance to compensate the contractor for his overhead expense. We recommend a charge of 10 per cent. on the total cost of work to the contractor to cover this item.

Credits to Owner

The owner shall receive from the general contractor the following credits:

1. Rebates to the amount of 50 per cent. of the original billed price for all lumber and material used in this work and delivered in good and serviceable condition to and accepted by the general contractor.

2. Rebates to the amount of 50 per cent. of the original billed price for all perishable tools and appliances used in the work and upon completion of the contract returned in good and serviceable condition to and accepted by the general contractor.

3. The full returned amount of any refundable deposit made and charged against this work.

To the sum of the items enumerated above, after proper credits have been given, a percentage is to be added for contractor's fee. We recommend a charge of 10 per cent. to cover this item.

Payments for extra work should be made monthly on or before the tenth of the month following the month in which the extra work is performed. Extra work invoices should be paid in full, no percentage on same being retained by owner.

As The Editor Sees It

SUCCESSFUL CONTRACTING—WHAT IT IS

A Discussion of the Many Factors That Often Mean the Difference Between Profits and Failure

BY L. ENGELMAN

Engineer and Estimator

In making a survey of the last twenty-five years the writer has often asked himself the question: What are the reasons why so many contractors fail in business between the ages of 45 and 55? Some drop out of sight entirely, some die in the poorhouse, and some are thrown on the mercy of their children or near relatives.

It seems strange indeed to learn of a man who started probably as a carpenter contractor or brick contractor, and made a success of his line of business, that he has wound up as a failure after seeming initial success upon launching out into general contracting.

The main causes of failure may be summed up as: 1. Bad management. 2. Lack of education, technical as well as general. 3. Lack of working capital. Before analyzing the various phases of these causes, let us first draw a general perspective picture of the contracting business.

In order to do this in as simple a way as possible, let us compare contracting with other lines of business, which will make the matter plain, inasmuch as the human brain is accustomed, in arriving at a conclusion, to start first of all by comparing.

The manufacturer is in a position to estimate the cost of his products to the hundredth part of a cent. There are very few uncertainties entering his calculations. Given a rod of certain lenth and diameter at a fixed cost, he can estimate to a nicety the number of bolts to be manufactured from this rod; neither rain, nor snow, nor unnecessary waste of time need enter into his calculations. Up-to-date machineries in his shop lessen his trouble, and his check on a man's daily work is complete.

Contractor's Difficulties in Cost Estimating

Compare with this your checking up on the day's work of twenty bricklayers. You cannot tell at the close of a day how many bricks each man laid; and furthermore, even under like conditions the day's work of the bricklayer will greatly vary.

The contractor must reckon with an endless chain of uncertainties, and unless he is a clear and quick thinker the chances are that he may meet disaster. Remember that your mistakes in a building cost you money and cause you trouble. You are not as fortunately situated as a physician who, by a death certificate, may cover up his mistakes.

There are usually two classes of men. One we may call the "thinking class" with an analytical mind, the other the "acting class," the one that either executes the orders of the thinker or acts in a spontaneous manner. Very few men, comparatively speaking, belong to both classes. We of course cannot consider here a certain mass of persons who simply live and hardly have minds of their own.

The contractor managing a business of say several hundred thousand dollars must be his own commanding general and his own general staff, to use, in our case, a military term; and there we find the main stumbling block for so many contractors who were very successful in conducting a small business requiring little work for the general staff, but who, on entering the area of a bigger field met their Waterloo. In some cases it is their own narrow-mindedness and self-deceit which did not allow them to engage the assistance and help of men trained in their respective fields. It is needless to say here that large offices have well trained men at the head of each department.

What Makes a Good Contractor

What are the essential requirements of a successful contractor? He must:

1. Be a master of retails without losing himself in details.

2. Know how to select the right kind

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 3513

BLUE PRINTS

of help and train the same for his particular needs.

3. Have the caution never to overreach himself in money matters, and be sure that credit will be extended to him.

4. Be a good business manager and financier.

5. Know enough to control field management.

6. Have tact, and education, and be sometimes a well groomed diplomat.

7. Educate himself to be an analyzer of all facts and human nature.

In the aforesaid the contractor's life was considered in a general way only; let us now view it at a closer range and we will have the following classifications as pertaining to his business: 1. Office management. 2. Field management. 3. Ethical side.

Subdivisions of His Work

1. OFFICE MANAGEMENT: This may be subdivided into (1) estimating, (2) purchasing, (3) cost keeping, (4) bookkeeping, (5) financing and (6) dealing with sub-contractors, architects and owners.

Estimating.—The salient points of correct estimating are: 1) exact quantity survey; (2) sound judgment in assigning labor cost on work, taking into consideration cost data on hand; (3) local labor and market conditions; (4) transportation; (5) season of the year; (6) equipment, tools, machinery and lumber on hand; (7) amount of percentage retained; (8) amount of working capital required; (9) responsibility of sub-bidders; (10) construction of building; (11) amount of space available for storage of material; (12) general market condition; (13) general labor condition; (14) clearness or doubtfulness of plans and specifications; (15) overhead and traveling expenses; (16) time limit; (17) liability insurance; (18) site expenses; and (19) reputation gained.

In a short article we cannot go into details and consider fully each point. Only the following, therefore, will be mentioned. If one person only compiles the quantity survey it will be well for him to list his estimate in such a way that he can readily detect any mistakes or omission. Take, for instance, a brick building 300 feet by 100 feet facing east. Figure the quantities of face brick required or each elevation separately and compare east with west elevation, and north with south elevation.

As a rule there should not be much difference between the net areas of either east and west or north and south elevations, provided the building has a symmetrical design. Follow the same principle for concrete and cut stone work, and figure each floor separately. The number of square feet of partition for the third, fourth or fifth floor usually will not vary greatly from the number of square feet required for any other of these floors.

Compare, furthermore, the total cubic yardage required for beams with that of the 2-inch or 2½-inch topping for each floor. Whenever you have trained your mind in this way it is remarkable how quickly you can discover your mistakes, especially when you use a slide rule in your calculations and chance to have made a mistake in pointing off decimals. Follow a certain system in your estimating practice and you will not only lessen the cost of estimating, but you will also make fewer mistakes.

Correct Estimating of Concrete Work

It is absurd and a fallacy to estimate concrete work at one unit price. Estimate the total cubic yardage required for say a 1-3-5 mixture; figure the cost of cement, sand and stone or gravel for this particular mix, and then add the cost of mixing and pouring. This cost may be 90 cents for a certain portion, or $1.25 for another portion.

It is equally absurd to use only one unit price per thousand for brick, regardless of whether you have an 8-inch or a 16-inch wall. Estimating labor cost requires first of all a thorough knowledge of practical construction.

The required time to complete a building is determined to a certain extent by whether the structure is to be a wall bearing type or one of skeleton construction. The time is also dependent on the available supply of mechanics, laborers, material and transporation facilities.

The fallacy of estimating the labor for millwork by the loose method of figuring it as 30, 40, or 50 per cent. of the amount of the sub-bid on millwork is plainly shown in the following example;

Contractor A has a sub-bid for millwork for $50,000 and estimates the cost of erecting the same by the correct method. His account stands as follows: $50,000 plus $15,000 for labor equals $65,000, total. Contractor B has a sub-bid for millwork for $47,000, and he estimates the labor cost at 40 per cent. His account stands as follows: $47,000 plus $18,800 equals $65,800, total.

A good estimator will consider not only labor and material costs but also present and future economic conditions.

Mere Bookkeeping Is Insufficient

Purchasing.—Purchasing requires a keen judgment. A good buyer may turn a "losing" job into a "winning" one. Financial management and purchasing are very closely interwoven, and as the

TRUSCON STONE-TEX

For Dampproofing and Decorating Masonry Walls

For Preserving Brick - Stone-Stucco-Concrete

THE TRUSCON LABORATORIES —

Cracking, spalling and general disintegration of concrete and stucco are caused by absorption of water. Masonry can be effectively protected by dampproofing the surface.

STONETEX is the masonry coating. Not only does it prevent moisture from being absorbed into concrete, stucco or brick, but it also covers the surface with a beautiful finish which lasts for years. Stonetex dries flat. It does not produce the "shiny" appearance of paint. Stonetex looks like masonry.

Rebuilt Instruments For Sale or Rent

Harrisburg. Architects, Laurie-Green & Co., 222 Market street, Harrisburg. Owners, Pennsylvania State Chamber of Commerce, G. F. Foss, secretary, Telegraph Building, Harrisburg, Pa. Stone, 6 stories, 29x95 feet. Sketches in progress.

School (high) (add.), Mahanoy City, Pa. Architect, Clyde S. Adams, 2038 Spruce street, Philadelphia. Owners, Mahanoy Township School District, Frank B. Patterson, St. Nicholas, Pa. Frame, 2 stories, 40x60 feet. Plans completed in 1920. Will be ready for bids in about six weeks.

Residences (6), Tamaqua, Pa. Architect, Benjamin R. Stevens, 1737 Filbert street, Philadelphia. Owner, Samuel Losos, Tamaqua, Pa. Hollow tile and stucco, 2 stories, 15x42 feet. Preliminary plans in progress. Bids will be taken in 1923.

Residence, Rydal, Pa. Architect, William Woodburn Potter, Real Estate Trust Building, Philadelphia. Owner, C. M. Cadwalader, care of architect. Stone, 2½ stories, slate roof, hardwood floors, hot water heating, electric lighting, tile work. Plans in progress. Architect will take bids in ten days.

Residences (18), Collingdale, Pa. Architect, Fred N. Greisler, 1035 Walnut street, Philadelphia. Owner, David S. Fuhrman, Aldan, Pa. Stone, brick and stucco, 2½ stories, 19x29 feet, asbestos shingle roof, pine floors, hot water heating, electric lighting, liktile. Plans drawn. Will take bids in 1923.

Residence, Brookline, Pa., $9,000. Architects, Lachman & Murphy, Drexel Building, Philadelphia. Owner, R. E. Seyler, Drexel Building, Philadelphia. Frame and stucco, 2½ stories, 24x30 feet, roofing undecided, pine floors, hot water heat, electric lighting, tile work. Owner is taking sub-bids.

Church, Columbia, Pa. Architect, Paul A. Monaghan, 1218 Chestnut street, Philadelphia. Owners, Holy Trinity Roman Catholic Church, Rev. P. H. Brueggeman, Columbia, Pa. Stone, 1 story. Sketches drawn.

Garage, rear of 532 Spruce street, Reading, Pa. Architect, Warren D. Heinly, 7 South Fourth street, Reading, Pa. Owner, William M. Fryermuth, 306 Bingamen street, Reading, Pa. Brick, 1 story, 43x34 feet, concrete foundations, electric work, asbestos shingle and composition roof, structural steel. Owner will build.

Residence, Arvon road, Merion, Pa. Architects, Tunis & Genther, 1423 Locust street, Philadelphia. Owner, Louis J. Tunis, 1423 Locust street, Philadelphia. Stone, timber and stucco, 2½ stories, 24x53 feet, slate roof, hardwood floors, hot water heating, electric lighting, tile and marble work. Owner is taking sub-bids due as soon as possible.

Stores and Apartments (2), Burmont road and Berry avenue, Drexel Hill, Pa. Architect, private plans. Owner, name withheld. Brick, 2 stories, 20x50 feet, slag roof, pine floors, hot water heating, electric lighting, tile work. Bowden Const. Co., 1935 Chestnut street, Philadelphia, are taking sub-bids due as soon as possible.

Residences (4), Cynwyd, Pa. Architect, private plans. Owners, name withheld. Hollow tile, frame and stucco, 2½ stories, 19x32 feet, shingle roof, hardwood floors, hot water heating, electric lighting, tile work. Henry D. Dagit & Son, 34 South Seventeenth street, will build and will take sub-bids in one week.

Armory, Wilkes-Barre, Pa. Architect, Thomas Atherton, Coal Exchange Building, Wilkes-Barre. Owners, State of Pennsylvania, B. W. Demming, secretary, Capitol Building, Harrisburg, Pa. Concrete, brick and steel, 2 stories, 350x500 feet, concrete foundations, electric light, tile, marble and terrazzo work, roof ventilators, skylights. Owners taking bids due December 16th.

Residence, Wallingford, Pa. Architect, R. Brognard Okie, Crozer Building, Philadelphia. Owner, Mrs. A. T. Wirz, Wallingford, Pa. Brick, frame and cut stone, 2½ stories, 25x53 feet and 44x29 feet, shingle roof, oak and pine floors, metal lath, iron work, bond, tile work (hot air heating and electric light reserved). Architect taking bids due December 11th.

Residence, Wallingford, Pa. Architect, R. Brognard Okie, Crozer Building, Philadelphia. Owner, A. H. Wirz, Chester, Pa. Stone and frame, 2½ stories, 104x30 feet, shingle roof, hardwood floors, hot air heating, electric lighting, tile work. Architect taking bids due December 11th.

Spring Water Bottling Plant, Shawmont, Pa. Architect, Henry L. Reinhold, Jr., 1513 Walnut street, Philadelphia. Owners, Keewis Pealty Co., 115 Broadway, New York City. Brick, slow burning, 2 stories, 85x35 feet, composition roof, cement and plank floors, vapor heating, electric lighting. Architects taking bids due December 11th.

Apartment House, Ardmore, Pa. Architects, John Harbeson and Paul P. Cret, Otis Building, Philadelphia. Owner, name withheld. Brick, reinforced concrete, stone and cut stone (terra cotta), 3 stories, 101x101 feet, Barrett roof, oak and pine floors, iron work, bond, tin clad and kalamein doors, tile and marble work, electric lighting (heating and plumbing separate bids). Architects taking bids due December 11th at noon.

Residence and Garage, Winston-Salem, N. C. Architect, Charles Barton Keen, Bailey Building, Philadelphia. Owner, C. A. Kent, Winston-Salem, N. C. Brick and hollow tile, 2½ stories. Architect taking bids due December 27th.

Pennsylvania Contracts Awarded

Warehouse, Johnstown, Pa., $675,000. Engineers, William Steele & Sons Co., 1600 Arch street, Philadelphia. Owners, Johnstown Terminal Co., Johnstown, Pa. Reinforced concrete, brick and steel, 6 stories and basement, 120x250 feet, slag roof, concrete floors, elevators, iron work, waterproofing, cork insulation, rolled steel sash and skylights, steam heating, electric lighting. Contract awarded to Turner Const. Co., 1713 Sansom street, Philadelphia.

Rectory, Collingdale, Pa. Architect, Paul A. Monaghan, 1218 Chestnut street, Philadelphia. Owners, St. Joseph's Roman Catholic Church, Rev. Otto G. Gromall, rector, Collingdale, Pa. Stone, cut stone and brick, 3 stories, 38x55 feet, Phoenix roof (slate alternate), oak and pine floors, metal lath, iron work, bond, tile and marble work, vapor heating, electric lighting. Contract awarded to McLaughlin & McNally, Eighty-first and Suffolk avenue.

Central Office Building, Hazleton, Pa. Architect, John T. Windrim, Commonwealth Building, Philadelphia. Owners, Bell Telephone Co., Seventeenth and Arch streets, Philadelphia. Brick, cut stone and steel, 2 stories and basement, 31x25 feet, slag roof, composition and cement floors, metal lath, demolition, steam heat, electric light, marble work, bond, iron work. Contract awarded to Franklin M. Harris & Co., 1520 Parrish street, Philadelphia.

Residence and Garage, No. 46, Wynnewood, Pa. Architect, Frank R. Seeburger, 1524 Chestnut street, Philadelphia. Owner, name withheld. Stone, 2½ and 1½ stories, 45x27 feet and 35x24 feet, shingle roof, oak, pine and cement floors, hot water heating, electric lighting. Contract awarded to John E. Kearney, 34 South Seventeenth street, Philadelphia.

Bank and Apartment (alts.), Galitzen, Pa. Architects, Johnson & Starr, Spooner Building, Harrisburg, Pa. Owners, Citizen's Deposit Bank, Galitzen, Pa. General interior alterations, partitions, tile and pine floors, electric light, tile and marble work, general alterations, window guards. Contract awarded to F. J. Couples, Cresson, Pa.

New Jersey Construction News

Auto Show Room and Office, Atlantic City, N. J. Architect, Byron H. Edwards, 34 South Seventeenth street, Philadelphia. Owner, Mrs. Margaret G. Smith, 3426 Atlantic avenue, Atlantic City, N. J. Brick and limestone, 2 stories, 26x100 feet, slag roof, tile and cement floors, hot water heating, electric lighting, tile work, cement work, copper and galvanized iron work, plate glass, art cement, oil burning equipment. Plans completed. Architect will take bids in a few days.

Residences (2), 705 Spruce street, Trenton, N. J., $9,000. Architect, private plans. Owner, Mary Wholey, care of builder. Brick, 2½ stories, 22x44 feet, slate roof, pine floors, electric light. Contract awarded to John Dzialo, 856 Pennsylvania avenue, Trenton.

Miscellaneous Construction News

Highway Work, Dover, Delaware. Owners, State Highway Department, Dover, Delaware. Contract RW-1, wall on Philadelphia Pike, 750 cubic yards excavation, 700 cubic yards recent rubble masonry. Owners taking bids due December 13th. Plans and specifications may be obtained on payment of $10.00. Certified check for 10 per cent. of bid must accompany each proposal.

(Continued from page 776)

vital points of good practice will be considered under financing, there is no need to go into details here. Keep in mind, however, that a "good buy" may nevertheless mean a very poor financial transaction.

Cost Keeping.—It is well known that there is a vast difference between cost keeping and bookkeeping, and it is a regrettable fact that comparatively few builders realize the importance of a sound and accurate cost keeping system. This will demonstrate the value of cost keeping:

Let us assume that 1,000 cubic yards of concrete are required for the basement walls of a certain building. In order to demonstrate great efficiency, the superintendent's report for one quarter of the work completed shows the

following: Ninety cents labor cost pouring concrete; total cubic yardage, 250 cubic yards, which would be the sum of his daily reports; 324.8 total of barrels of cement used. The contractor, who has estimated 95 cents for labor cost, is fully satisfied with this report of the superintendent, but the up-to-date contractor will demand a carefully prepared analysis.

Let us see what a good system of cost keeping would demonstrate.

One quarter work completed calls for an expenditure of 290 barrels of cement, as we have only 250 cubic yards. The total labor was $252 according to the time sheet, and therefore the unit price per cubic yard of concrete was $1.01 instead of 90 cents as reported by the superintendent. This check also develops the fact that 324.8 barrels of cement have been used, while only 290 should have been used.

Just watch your laborers loading sand or gravel in barrows or carts for concrete on hot days, and you will perhaps notice that when your men become tired they will not load the barrow or carts to the required measure—instead of having a 1-3-5 mix you will pour a 1-2-4 mix. You may say this should not occur under efficient field management. Well, a good many things should not happen in this world, but they "happen" anyhow—even a preacher becomes intoxicated. At any rate, cost keeping will tell you the efficiency of all your men and, at a glance, how many frames your carpenters set in a day, besides the exact cost of all your millwork labor; and, if given some thought, it can be arranged in a very simple manner.

Other Factors in Office Management

Bookkeeping.—Bookkeeping should not be merely an operation of posting debits and credits; it must work in co-operation with the cost keeping. Bookkeeping cost keeping must be the two watchdogs for the builders. It is, however, a common state of affairs to have book keeping show only the amount of bills payable. Correct bookkeeping should be a check on the estimated quantities and a check on preventable loss, such as loss on cement or plaster sacks, and on material left over from jobs.

Bookkeeping should tell the contractor the amount paid out for small tools, repairs on equipment and at the job, office expenses, etc., and other items usually not separated but booked under one general heading.

Financing.—The financial affairs have caused mental agony to many contractors and undermined their health. These troubles take clear vision away from you and cause a steady drain on your nerve power. They are responsible for your losing sight of important items.

There is only one way of getting out of this Scylla and Charybdis. First of all, you have certain important duties toward your family; you must protect it in case of your death. Therefore, put your life and accident insurance in order. If your business requires a larger amount of working capital than you possess, and your banker refuses to furnish you the same, then you must raise the required amount either from your friends or by taking into your business a silent or an active partner. Remember that your stepping stone may be finally your stumbling block.

It is poor financial management to borrow capital at 7 or 8 per cent. interest in order to discount bills. It is poor financial management to buy material on capital borrowed at a high rate of interest if the material won't be paid for by the owner until after six or seven months; to have a burdensome overhead expense; to buy equipment that is either too small or too big; to purchase goods too soon when the market has a Bear tendency, or to postpone purchasing when the market has a Bull tendency.

Your financial affairs must be diagnosed in the same way as the bacteriologist isolates disease germs. Use your mental microscope, make a "culture" of the germs and find the respective antidote. All financial trouble is caused either by lack of working capital or bad management.

Dealing with the Subcontractors, Architects and Owners.—The greatness or deficiency of your character and of your technical education will either help or hinder you in dealings with architects, owners and subcontractors. At any rate, firmness, diplomacy and a thorough knowledge of human nature will be required in almost all cases; many lawsuits could have been avoided if the builder had used good judgment. Remember the rule of the Chinese philosoper, Confucius, "A man that cannot govern himself cannot govern others."

Your future business will greatly depend on what reputation you enjoy among business and professional men.

Activities on the Job

2. FIELD MANAGEMENT: Field management involves consideration of (1) equipment; (2) storage of material; (3) placing of machines, derricks, etc.; (4) laying out a definite work plan; (5) organization and system.

In buying the required equipment you should consider the past, the present and the future. By the "past" is meant what has been your experience, or those of others, with a certain type of machinery? By the "present," Will the machinery you intend to buy be suitable for your purpose? And by the "future," Can you use it in the line of work you intend to follow, and is the machinery well constructed?

Points 2, 3, 4 and 5 must be considered in relation to local conditions, types of structure, market conditions and the season of the year at which the new building is to be started. Suppose you had a contract for a group of buildings of which two or more were of smaller size than the balance, and building operations were to start in July. Maybe in this case it would be best to lay out a plan with the intention of getting the roofs on the smaller buildings by fall, thus enabling you to work all through the winter.

Unfair Practices

3. ETHICAL SIDE: Some look upon the contractor as a "roughneck," a "cheater," or the personification of dishonesty." It is true that some deserve this description; however, it must not be overlooked that in many instances the contractor is driven to dishonesty. Suppose the contractor receives the contract for a certain building, and the architect, who is usually the sole interpretor of the plans and specifications, rules that a certain item should be furnished in a more expensive material than that shown on the plans, or it may be he has overlooked certain items and compels the contractor to furnish them, referring him to the specifications, of which one paragraph reads, "The intent of these specifications is to furnish all material complete for the structure, and any omissions from the drawings or specifications shall be furnished by this contractor whether called for or not."

Perhaps some readers think that this reference is made to second or third class architects. Sorry to state, the quotation was taken from a set of specifications prepared by a "licensed" architect, and the unlucky builder must console himself with the reflection that the last treatment he will receive in this world will be from a "licensed" embalmer.

That the builder is in the business to make money is something fully justifiable—even the professional man is quite often nothing but a slave of god Mammon, and one cannot expect charity in money matters even from a hosiptal. But money alone must not be the builder's whole aim in life. He must work for a reputation, not only for himself but also for his family and for his calling. Suppose you had built a public building in your home town in a very flimsy way, and that after you were dead and gone your children had to feel ashamed of your acts.

It must be admitted that the master builders of the ancient and middle ages were working for a reputation and were inspired by lofty ideas. Follow the his-

tory of the Egyptians, Persians, Greeks, Romans, Moors, and the builders of the Gothic cathedrals, and you must admit that they have build monuments which we still admire.

The pride of the old Moorish builders is forcibly expressed in their saying: "Quien no ha visto Granada, no ha visto nada." (He who has not seen Granada has seen nothing.)

Putting Ideals Into the Work

The days of Michael Angelo are passed, and architecture and building are now two distinct occupations; but nevertheless the builder of our present day has entered a new field in which he plays an important role, and that is our economic life.

There is no wish here to preach Idealism, since contracting is Realism personified; but unless we combine the teaching of Aristotle with that of Plato and live accordingly, our lives will be aimless, and this leads us to another cause of business failures in the contracting field; namely, mental dullness instead of new inspirations.

The purchase of either too small or unsuitable machines for a certain job, or wrong placing of the machines, may mean considerable loss of money and time. While usually a central plant is the most economical one, it may sometimes be more economical to use one or more smaller ones in remote sections. A practical example will illustrate this assertion very plainly.

A contractor finished a big concrete job with the exception of a small building containing 195 cubic yards of concrete and situated several hundred feet from the main part. He decided to move his big plant over to the place where the small building was to be erected, and it took two days to move and set up the machinery. This was in December.

On the third day it turned very cold and snowed for one week. In this case it would have been cheaper to use a small mixer and wheel all concrete, since plenty of common laborers could be hired for 25 cents an hour, while the cost of setting up the big plant was $175; and since, above all, the contractor could have finished his job in two days. Field management requires deep thinking. Don't jump at conclusions or act hastily.

Shifting your gang from one place to another more remote—leaving small details unfinished—is a wasteful act. Just leave, say, a few unfinished concrete window sills in an otherwise completed portion of a building, and you will find that these few sills cost you a lot of money.

Some Things to Remember

Always keep in mind: 1. That the more quickly your building is completed, the more money you will make. 2. To prepare in spring for the winter months. 3. That unnecessary shifting of scaffolding and labor gangs cost money. 4. That a gravity system is cheaper than manual labor. 5. That any machinery that is not in use is losing you money. 6. To practice construction economy in all your acts. 7. To get the roof on your building as quickly as possible and start your plastering, marble and terrazzo work, and the placing of hardware and millwork, whenever one part of your building is ready for this work.

Field management is the determining factor as to whether the contractor will make money on his job or not. Organization in the fullest and truest meaning must reign everywhere, and unless the superintendent is an organizer, loss or failure will be the result. The elimination of waste alone will not be sufficient.

On a big concrete job the contractor may lose several thousand dollars on form work alone. It is a general occurrence for carpenters, when they want a short piece of lumber, to cut it from a long board. Form work must be designed by an engineer fully experienced in this class of work, and a completely equipped power saw and planer will pay for itself in a short time. Who has not noticed the waste of time and money in transporting lumber; and instead of having some salvage of the form lumber, nothing but kindling wood is left over from the job.

Every man should have an avocation besides his regular vocation, and should take care, above all, of his health. Many a builder works from twelve to fourteen hours a day and keeps this up for years, and suddenly he begins to disintegrate, geologically speaking. As history repeats itself, so do the events of the human life—the disintegrated Roman Empire finally became decomposed, and whenever any man finds himself on the road ot disintegration, mentally or physically, he should stop at once and turn back to the road to recuperation.

To raise the standard of the builders to a higher level these suggestions are made:

1. Discontinuing of the issuing of bonds to irresponsible builders by the bonding companies.
2. Practising of fairness in dealings between architect, owner and contractor.
3. Developing of educational efforts and instruction by builders' associations.
4. Obtaining of better technical and general education on the part of the contractor.
5. Cultivating of ethical pride by the contractor.

Unless our aim is for betterment and higher ideals we soon disintegrate. We will lose our place in history if we stop improving or neglect to put "value in our work." The cardinal points which should govern all our actions are liberty, loftiness, purity, honesty, truthfulness, thoroughness and tolerance.

—*The American Contractor.*

NECESSITY OF PROTECTING CONCRETE AND MASONRY

Applying the "Save the Surface" principle to Concrete and general Masonry as well as to wood, iron and steel.

It seems rather inconsistent with the general spirit of Efficiency and Conservation so intimately associated with American business life that so little is done to obtain longer life and better service out of exposed masonry construction—especially concrete and stucco.

Every well managed manufacturing plant is an example of well preserved wood and steel surfaces; sheds and fences are coated with lead, zinc and oil paint, while steel sash, tanks, stacks and structural metal work have their protective covering of rust-inhibitive paint.

Wood and Steel Receive Weather Protection

But in the same group of buildings, in the midst of all this weather-protected wood and steel, one will find thousands of square feet of bare concrete, brick or stucco, without any protective coating whatever—left entirely exposed to the weather.

In some cases, this lack of protection seems to do no apparent harm, at least not for a while, just as an unpainted wood structure might occasionally resist rot and decay to an unusual degree for a short time.

Why Neglect Masonry?

But to offset these exceptions, one will also find concrete surfaces disintegrating so badly as actually to expose large sections of reinforcing steel—cement plastered walls checked so thoroughly as to indicate the immediate necessity of resurfacing; stucco surfaces rendered unsightly by reason of weather streaks and scaling. It is not enough to say that such evidence of disintegration are unsightly—that they indicate property depreciation, loss of prestige and value; they are also dangerous and costly.

Neglect Difficult to Explain

It is difficult to explain this neglect of weather-protection that should be accorded Portland cement construction except that we might ascribe it to the natural inclination to associate concrete, because of its solid, substantial nature, with imperishable materials requiring no weather protection. Such an attitude, of course, is wrong, because at the last analysis, no building material—not even polished granite, is imperishable or unaffected by change when continuously exposed to the weather.

Yet neglect it certainly is, and neglect of the grossest kind, as a little reflection will very soon indicate that concrete,

stucco, brick and stone are just as urgently in need of weather-protective and preservative measures as their apparently more perishable brothers, wood and steel.

Water the Active Element of Destruction

Take, for example, the action of water on concrete or stucco. Water is very easily absorbed into a concrete or stucco surface, and if we remember that water, on freezing, expands 10 per cent. of its volume, we can appreciate what an enormously disruptive force a little absorption of water into a concrete surface can create.

Frost

The disconcerting feature of this is that each successive absorption of water, freezing and thawing, has a tendency to make it easirer for future absorption. Water, we might say, opens pathways for itself in the concrete so that moisture can penetrate deeper with each absorption. Eventually, it attacks the reinforcing steel, causing rusting.

The rusting of the reinforcing of structural steel is again accompanied by an increase in volume of the steel, because rust occupies two and two-tenths (2.2) times the space of the original metal. Consequently, the rusting of the reinforcing steel is dangerous not only on account of the weakening of the reinforcing, but more especially on account of the powerfully disruptive force which this corrosion exerts on the surrounding concrete, long before the weakening of the steel becomes a factor of danger.

However, while frost is a very dangerous element in the disintegration of concrete, it is not by any means the only element.

Probably a far more consistent and insidious source of trouble is experienced through the changes in volume in Portland cement construction by reason of alternate wetting and drying. The expansion and contraction of metal as a result of heating and cooling is very generally known, but that there also takes place an expansion and contraction in a bar of concrete as the result of wetting the bar and drying is not so generally known.

Experiments by Prof. Alfred H. White, of the Department of Chemical Engineering of the University of Michigan, as well as the work of various other scientists along these lines and covering a long period of years, have been watched with considerable interest.

Such expansion and contraction induces internal strains in the concrete, likely to cause dangerous cracks, exposing the steel to direct contact with the elements, causing rusting of the reinforcing and disintegration of the concrete members.

For further evidence of the necessity of protecting concrete and stucco, as already explained, one need only observe the frequent examples of scaling concrete, or cracked and scaling stucco. It is true that the same disadvantages apply to brick and stone, although brick and stone construction is of somewhat different character, and hence the damage done to the surface is not always so productive of apparently harmful results as in the case of concrete. Nevertheless, moisture does penetrate brick and stone walls, causing disintegration at the mortar joints, loosening the brick or stone, and imparting decided evidences of dampness on the interior.

The point that should never be lost sight of is that water is the great destroyer. Experiments have proved that moisture is the one element absolutely essential to the rusting of steel. In a similar manner, it is equally essential to the rotting of wood, to the crumbling of concrete, the cracking of stucco, or the general disintegration of any building material. Without moisture, disintegration rarely occurs. The pyramids of Egypt stand today after five thousand years, because they are located in a comparatively dry region. Transferred to the United States, or to any other country subjected to climatic changes such as our own, the same structures would not last fifty years.

This point was very forcibly brought to our attention when the Khedive of Egypt presented us with the celebrated obelisk known as Cleopatra's Needle. This obelisk had withstood fairly well the ravages of time for at least three thousand years. At the end of two years after having been set up in Central Park, New York City, very decided evidences of erosion began to appear. The surface of the stone began to scale badly and numerous pieces of rock began to fall. Moisture and frost were the cause of the trouble, and steps had to be taken to preserve this valuable memorial of the Pharoahs by protecting the surface against water.

Let it be stated definitely that any masonry surface which is exposed to the process of weathering, involving extremes of climatic conditions, wetting, drying, etc.. should be adequately protected. This applies with equal force to natural stone, artificial stone, unfaced brick, stucco, concrete or plaster.

LET US THINK THAT WE BUILD FOREVER. OR THE PRESENT MAGNITUDE OF THE BUILDING INDUSTRY

BY H. A. BRICE

Few are aware of the magnitude of the great construction industry and what it represents. Reliable data recently compiled show it to be second only to that greatest of all industries, agriculture.

It has been called the key industry in that it unlocks practically all of our activities and resources. It reaches into the mines and forests and into a multitude of factories, and draws from them the raw material and finished products which are wrought into buildings and other construction enterprises.

Approximately 90 per cent. of all iron ore, copper, zinc ore and 95 per cent. of lead production are consumed by construction. About eleven million persons, either as workers or as members of workers families, derive their living from construction. The support given to agriculture and trade by the annual expenditure of this great number of persons is too apparent to require discussion.

The value of new capital issues during 1920, so far as data have been reported, reaches the high figure of four and one-half billion dollars, consisting of State, municipal, railroad and industrial securities; and of this total approximately 60 per cent were issued for construction in some form or another.

While it is true that the builders who handle the final assembling of materials represent only a limited part of this industry, they may be likened to the keystone of the arch. On them depends the great responsibility for safeguarding the industry and the nation.

Looking into the future of construction we seem to be faced with a situation unparalleled in its history. Aside from the development we might expect from the normal growth of this country and the great highway building program now under way throughout the country, we have an accumulated shortage resulting from that period of restricted building during the war when the industry was practically at a standstill. It has been conservatively estimated that it would require approximately ten years to catch up this shortage.

For the period including from about the first of the year 1915 until the beginning of the present year, if one were to plot a curve representing the average change in construction costs, he would find that the line would rise gradually though with periods of fluctuation, until about the middle of 1920, when it would reach a peak of approximately 250 per cent. above the level at which it began. From that date a more rapid descent takes place until the fall of 1921, when general business conditions began to improve. From that time up until the present, the line maintains practically a level.

In the face of the fact that at the present time many of the larger cities are announcing building programs for the coming months that are staggering to contemplate, it would seem hardly possible for one to expect further decline in construction costs within the near future.

—*Building Age.*

As The Editor Sees It

DOES AN ARCHITECT MAKE A GOOD CONTRACTOR?

*FROM the subject which has been given me, it would appear that you, gentlemen, as architects, have awakened to the fact that there is a growing tendency to depart from what has heretofore been generally recognized as the proper procedure in construction—that of an owner commissioning an architect or an engineer, and he, in turn, letting a general contract by the competitive bid method.

This procedure is well established and sound and, if the principles involved therein are adhered to, there is no occasion for nor will there be any departure therefrom.

There is no denying the fact, however, that owners, architects, and contractors are departing from this procedure! and it necessarily follows that their departure is the result of a belief that by so doing they can better accomplish their purpose.

It is to be expected that my viewpoint of the situation is from the standpoint of a contractor, or perhaps I should say from a group of contractors as I am speaking for the Southern California Chapter of the Associated General Contractors, and I desire to say here that our Association deems it a privilege and an honor to be given the opportunity of addressing you on this subject.

Why do some owners, architects, and contractors feel that their purposes can better be served by a departure from the regular procedure?

In so far as the owner is concerned there is only one reason, he is made to believe that by so doing he is increasing the purchasing power of his dollar.

Lump Sum Contract Most Economical

Generally speaking this is not true. Whether the departure be along the pathway of day-labor methods, percentage contracts, fixed-fee contracts, segregated contracts or whatnot, the owner's interest will not, in the long run, be as well served by any of them as by a lump-sum form of contract in which the contract price has been determined by the taking of competitive bids.

Do you gentlemen suppose for one minute that the citizens of Los Angeles would have voted to spend seventeen million dollars for the contruction of new school buildings or twelve million for a new outfall sewer, had they thought this money would be expended in any manner than by contracts based on competitive bids from general contractors?

I can only assume as to why the architect ventures a departure. It may be due to the influence of the owner. It is probably very often due to the additional fee he receives, and just as often because he feels that by so doing he will obtain a more satisfactory execution of his plans and spectifications.

A contractor's reasons are many, some of them fancied and some of them real. A goodly number have no foundation whatever, and these are generally the result of his lack of appreciation of the obligation he assumes by the signing of a contract.

I intend to be very frank and name a few of the real reasons why contractors, who feel themselves capable, encroach on the architect's field.

The construction industry, of which we are both such a vital part, is now conceded to be the second largest industry in the country, second only to agriculture. There has been a decided change in the personnel of the general contractors in that industry during the past 20 years or even during the past 10 years. Improved methods are definitely eliminating the rule-of-thumb contractor, and the contractor of today feels that he is entitled to and should receive the same recognition as the architect or engineer.

Your profession has permitted commercialism to gain such a foothold that, in many cases, completeness of plans and specifications is sacrificed in order that more of the fee may be retained as a net profit. Where this is done controversies arise, extras are claimed, and both owner and contractor are dissatisfied.

Government Red Tape Offset

The thing that makes Government red

tape on construction work bearable is the wonderul completeness of the plans and specifications and the exactitude with which one can determine the volume and kind of work to be done.

The custom of calling for such a multitude of alternate bids is not looked on with favor by the contractor. He feels that it is part of your service to the owner to pre-determine the volume of work to be done and the kind of materials to be used.

Contractors feel that in many cases bids are requested and their time consumed in preparing estimates on work, when the architect knows there is not even a remote possibility of the work going ahead; and it is a very common occurrence for a contractor to submit a proposal to an architect and for that proposal to be held for a month or more without being accepted or rejected, the contractor being unable to obtain any information regarding same. This is obviously unjust and should not be continued if it is your intention to recognize the service rendered to the industry by the contractor.

Draw your contracts so as to show fairness to both parties concerned, the owner and the contractor. Insert an arbitration clause in them so that honest differences may be settled out of court. This may be working a hardship on our friends, the attorneys, but nevertheless it is a most satisfactory way of adjusting disputes.

In your contracts and specifications avoid the shifting of responsibility. I have seen contracts based on specifications which provided that the contractor was to assume all responsibility for plans and specifications complying with city ordinances.

Tit for Tat

Conditions such as I have mentioned have a tendency to create a desire in the contractor to undertake himself the architectural service necessary to a construction project, and it is with increasing frequency that you hear of it from the larger contracting firms.

Please do not think for one moment that I fail to appreciate the fact that in many instances contractors have, by their unsatisfactory methods, driven the architects to seek a method whereby they might be eliminated.

It is necessary, however, that we tell you our troubles and you tell us yours if anything is to be done to check this tendency to encroach on one another's field.

There never was a truer saying than this: "A man who is his own attorney has a fool for a client." The principle is applicable to construction. We each have a distinctive service to perform and I doubt very much the ability of either of us to sucessfully assume the other's position.

Our Association will heartily endorse any effort on your part to eliminate the undesirable man in the business, because by so doing we both will be rendering a really honest service to the public. Unless such a service is rendered there is no justification for the existence of yours, ours, or any similar organization.

FRED F. MORAN, of the New York State Department of Education and Supervisor of the Development for the Apprenticeship Commission of the New York Building Congress, in discussing apprenticeship at the meeting of the Philadelphia Building Congress last week said, the New York Building Congress has over 500 members and at their bi-weekly luncheons they have an attendance of about 325 members. To date they have had among their many contributors the Union Carpenters, who have contributed $1,000 and the Painters and Decorators, who have contributed $1,250 to the apprenticeship work to their Congress and pointed to this as showing how the workers feel toward training of apprentices in the building trades.

The Standard Oil Company in New York commenced their new building in the off season to demonstrate the feasibility of correcting seasonal unemployment.

The painters and decorators have worked out an ideal system, brought on by the knowledge that 75 per cent. of boys leaving school from 14 to 15 years old start out for any kind of work and get nowhere. They flounder around until they are 20 years old, and then they have forgotten all they learned in school. A very few enter the trades.

There are four or five vocational schools in which boys are supposed to stay four years, but in which they rarely stay more than two years. A great many only remain a few months, and there is no direct contact between these schools and industry. Therefore, the effort of these schools is wasted, and there are no value whatever to industry.

The unions realize that a real union must have skilled mechanics and labor is at the present time behind the movement to have laws regulating apprenticeship. Under the Building Congress program for apprenticeship, the employers have a guaranty to take boys at the end of two years, pay them $4.00 per day as second year apprentices. Under this plan, they are compelled to attend night school two nights per week and two hours each night. The painters and decorators held an examination for instructors among the locals and from a large list they selected twelve men which they recommended to

TRUSCON Agatex HARDENER

BOOKLET ON REQUEST

Shipped as dry Crystals, for making Concrete Floors Hard as Iron

THE TRUSCON LABORATORIES —

HARDENED CONCRETE FLOORS DO NOT DUST

It is not necessary to put up with dusting cement floors. Over night a soft cement surface from which the cement dust can easily be scratched with the toe of the shoe—can be transformed into a hard, impenetrable floor that will not "sand" or crumble, even under the hardest foot traffic. Phone or write us for information.

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., November 29, 1922. Sealed Proposals will be opened in this office at 3 P. M., December 27, 1922, for the construction, including mechanical equipment, of the United States Post Office, at Leesburg, Va. Drawings and specifications may be obtained from the Custodian of the site at Leesburg, Va., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 792)

the Board of Education. The latter body held a further examination and passed on six from which one man was selected to be the practical advisor of the boys taking apprenticeship under this plan so far as the painters and decorators are concerned. The Building Congress also appointed a trade annalist to assist in placing the boys properly where they would gain the most knowledge and where their work would be of the utmost value to the cause.

The Carpenters' Union have adopted a similar program with slight reservations, and now have 325 apprentices in the City of New York.

The New York Building Congress urged the Board of Education to maintain their appropriation of $50,000 to carry on the night school work for the ensuing fiscal year, which they did, and likewise added $20,000 for other special work in this connection, making a total sum available of $70,000 for the apprenticeship work in New York City for the coming year.

Sheet Metal workers have had for some time a real apprenticeship program and their work is financed by the employers giving $20,000 and labor giving a like amount on which they operate their Union School. Their records show that out of 200 boys, 180 of them had 100% attendance. If they do not attend school or are unsatisfactory, they do not get the new cards which are issued to them and which entitle them to an automatic increase in wages. The New York Building Congress has established permanent headquarters in the Grand Central Station and they act at this office as a general clearing house for all the boys in apprenticeship work which come under their jurisdiction. They place boys in school, keep records of their progress, place the boys with the employer when ready, and move them from one employer to another, as may be to the best interest of the boy.

The electrical workers are about to adopt the Building Congress program, similar to the ones now in vogue for the carpenters, painters and decorators.

The plumbers are taking up this matter and have already appointed Committees of four from the Masters and four from the Journeymens to discuss the apprenticeship work with the Apprenticeship Committee of the Building Congress.

Mr. Moran at this point announced that each trade sets their own standards.

The goal is for continuous employment and the only obstacle which they have found in New York City is, the trouble to get individual employers to put on apprentices when they can. When the apprentice is discharged, it is up to the Building Congress to locate him a new job. The Building Congress is against the specialization in the trades and for that reason they would not allow a boy to remain too long in any one shop when they find out that his chance to learn more of the trade is being jeopardized.

Mr. D. Knickerbacker Boyd, President pro tem of the Philadelphia Building Congress, read a letter to Mr. Charles F. Bawder, Director of Industrial Arts of the Philadelphia Board of Education, which set forth the fact that at a special Committee Meeting, represented by three of the Master Plasterers, three of the journeymen plasterers and five of the Building Congress it was unanimously agreed that the Master Plasterers' Association and the Operative Plasterers' Protective Association would co-operate to the fullest extent possible with the Board of Education in conducting classes for plasterers, both apprentices and journeymen, and will see to it that sufficient and properly equipped persons shall be available and that instructors and the necessary tools would be furnished.

Mr. Bawder announced that the Board of Education are ready to act and are now seeking class rooms suitable for the establishment of the training classes in plastering apprentices and that he had the assurance of co-operation of the Superintendents of the Board.

CONFERENCES ON HOUSING

(Extract from the forthcoming annual report of the Secretary of Commerce for the fiscal year 1921-22)

The shortage of some 1,000,000 dwellings as a result of suspended construction during the war led to widespread demand for Federal legislation and assistance. Under an appropriation from Congress an investigation of the situation and possible remedies was made by this department. During the process of the inquiry numerous conferences were held with the various branches of the building industry and with representatives of municipal and civic bodies. It appeared that the retardation was due to (a) the acute credit situation; (b) high prices of material and labor; (c) unsavory business ethics in certain localities; (d) wasteful practices in their contribution to costs.

It was concluded that the first two causes would in the main cure themselves by the general fall in prices then in progress. The third could only be cured by vigorous action of the Federal and State authorities, a large measure of which has been accomplished. It was concluded that emergency legislation or Government finance was not desirable and that except for a vigorous support of the proper co-operative service indicated below, the Government should keep out of the housing business.

It was considered on all sides that real service could be accomplished in a general aid by the department to the creation of, and assistance to, the already existing voluntary bodies permanently engaged in developing home ownership. A small division was created in the department the purpose of which was to stimulate such local activity by acting as a clearing house of ideas and information. One result has been the creation of voluntary bureaus in many municipalities for advancement of home ownership and where advice on finance and aid by furnishing designs and specifications of small houses could be obtained at a nominal charge.

Systematic measures of co-operation were set in motion in trade and civic bodies for the eliminating of waste in various directions, and thus a reduction

of construction costs. Typical among the latter activities was the appointment of a committee from representatives of the important professional and civic associations to formulate a standard building code, as it was the general concensus of opinion that the varying regulations in force in hundreds of different municipalities, founded as they were without scientific study, had imposed an unnecessary cost upon building of from 10 to 20 per cent. Before the drafting of the recommended code for small houses, a large amount to experimental work was carried on in the Bureau of Standards, and suggestions obtained from over 100 different municipalities. A tentative draft was then submitted to some 975 engineers, architects, municipal officials, and representatives of the building industry, whose useful criticisms were incorporated in the final draft. The code is already being adopted in some municipalities. Work in elimination of waste, in advancing voluntary standardiation and inspection of qualities and grades, in elimination of unnecessary variation of dimensions of building materials, and in the simplification of specifications have been undertaken by experts from the department at the request of an acting in cooperation with building material, contractors and consumers' associations, with gratifying results.

THIS year we are experiencing phenomenal winter activity in the building game. Not only in Philadelphia, but throughout the country there is little sign of any seasonal curtailment of construction work. Of course, the contractor has lately learned some very valuable lessons in the matter of winter building. A few years ago, the large building program being carried on this winter would have been thought most inadvisable if not impossible. Of course prices will be high. Added precautions, necessary in cold weather; high wages being paid; scarcity of materials and transportation facilities all add cost to the jobs planned for the winter. So far the weather has been all in the favor of the builder and much winter work has been gotten well under way before any really freezing weather has made progress difficult. In Philadelphia twenty-five hundred houses, more than the yearly average, will be erected this year. The average is 7,200, and so far permits have been issued for erection of 9,318 dwellings of the one, two, and three-story type, costing $46,433,620. Tenements and rooming houses, which were known as apartment buildings until a recent act of the Legislature drew a distinction, bring the housing total up to 9,374 buildings costing $50,354,620. Permits were issued for 560 houses, costing $3,379,050, for November.

Estimated cost of all building for which permits were issued for the eleven months of this year is $106,913,680, which is nearly three times the total for the same period of 1921. There is an increase of 1,747 permits, making the total for all classes of construction 21,394.

While dwelling construction predominates, as has been the rule throughout this year, several other classes are active, principally factories and hospitals. Nine manufacturing buildings estimated to cost $1,361,500 were started last month. Garages, too, continue to be active, permits having been issued for 164 to cost $498,585. Garages in the basements of new dwellings are not included in this total.

A statment, compiled by William Gamble, statistican, Bureau of Building Inspection, follows:

Character	Permits	Operations	Est. Cost
Dwellings, 1 story	2	2	$3,000
Dwellings, 2 story	101	507	2,757,105
Dwellings, 3 story	15	40	386,000
Dwellings, frame	8	9	42,900
Tenement house	1	1	150,000
Apartment house	1	1	40,000
Stable	1	1	1,600
Manufactories	9	9	1,361,500
Workshops	7	7	21,300
Garages	150	164	498,585
Office buildings	5	5	503,700
Stores	8	8	303.150
Warehouses	5	5	87,000
Schools	2	2	735,000
Hall	1	1	35,000
Municipal building	1	1	14,500
Hospital	1	1	1,400,000
Clubhouse	1	1	132,000
Band buildings	3	3	805,000
Places of amusement	2	2	841,000
Miscellaneous buildings	12	12	23,500
Additions	196	203	724,590

Heaters	1	1	6,075
Fire escapes	12	12	4,840
Signs	37	40	17,680
Totals	1,088	1,558	$11,416,730

PRESIDENT HARDING CONFERS DISTINCTION ON PHILADELPHIA ARCHTECT

President Harding recently announced the appointment of Milton B. Medary, Jr., prominent Philadelphia architect, as a member of the Federal Commission of Fine Arts, to succeed John Russell Pope, whose term recently expired.

Mr. Medary collaborated in preparing tentative and preliminary plans for the Sesqui-Centennial Exposition.

He was educated in the University of Pennsylvania School of Fine Arts and has been practicing his profession in Philadelphia for more than twenty-five years. He was at one time second vice president of the American Institute of Architects and also president of the T-Square Club of Philadelphia, and is a member of the Commission on Church Buildings of the Episcopal Church for the Diocese of Pennsylvania and chairman of the Committee on Designs of Workingmen's Villages, United States Department of Labor.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

As The Editor Sees It

INDUSTRY of all kinds is still facing a serious shortage of both skilled and common labor. Steps being taken to make apprenticeship attractive were discussed at length in the GUIDE several weeks ago. This work is still going forward. From many localities come encouraging reports of methods being tried which will enable these communities to take full advantage of the Smith-Hughes law. Of course, these experiments are in their infancy, but they are steps in the right direction and much good should result from efforts along these lines.

So far as common labor is concerned nothing is being done to relieve this shortage. So many more laborers have left the country than have come in that the shortage is assuming alarming proportions. The only solution to this problem is a revision of the present restrictive immigration laws. According to *Manufacturers' News*, during the 13 months ending July 31, 1922, only 40,098 common laborers came into the country, whereas 105,105 left America, leaving a shortage of 65,007. William Nelson Pelouze, Chicago, President Pelouze Manufacturing Company, writes the *News* that,

I know of no subject that should be of more vital interest to the people of the United States today than that which relates to the matter of immigration. The present immigration laws are entirely too restricted and are inadequate to meet our present economic conditions.

There is an urgent need for an increased supply of unskilled labor. This class of labor today, owing to its scarcity, is receiving skilled wages. The country is in dire need of what is usually known as common labor, for employment in our industries, on the farm and in the building of our roads and the cleaning of our cities.

The cost of living is absolutely dependent upon the law of supply and demand. The labor cost in everything produced is of such a high percentage in proportion to the material itself, that it would seem to behoove our government to adopt the only sure method of reducing the high cost of living, by enacting an immigration law that will permit of a larger supply of labor in all branches where a known shortage exists and is sorely felt.

William Butterworth, Moline, President, Deere and Company, writes concerning the immigration law:

We should like to see the law revised so that—

(a) Immigration would be handled through a non-political commission.

(b) The selection of immigrants to be made on the other side.

(c) The number to be admitted annually or semi-annually to be varied by the demands here.

(d) A requirement placed on each male immigrant to become a producer.

(e) The demand for labor on the part of any industrial or farming community should be cleared and approved first by locality or district, second by state, and third nationally, before a shortage of labor could be declared.

(f) Great care should be exercised by our government in selecting the right immigration and seeing that it becomes properly placed, and that such immigrants are followed up to insure that they are properly placed and on the way to be assimilated into American life.

FIRE RESISTIVE QUALITIES OF FRAME BUILDINGS PROTECTED BY STUCCO AND PLASTER ON METAL LATH

By WHARTON CLAY, *Commissioner Associated Metal Lath Manufacturers*

Ever since its advent into the building field thirty years or more ago, metal lath has been recognized as a superior base and reinforcement for plaster. Its original use was for solid and hollow partitions, curved ceilings and a base for ornamental plaster work in fire resistive buildings, but since its crack prevention ability was recognized, and as good quality of wood lath became more and more difficult to secure, it has come to be used with increasing frequency as a base for plaster in wood joisted or frame buildings. In the early days fire prevention was little thought of and

BLUE PRINTS

our great national fire waste was not realized by the general public or by the insurance companies, or even by building officials themselves. Years ago, however, building codes began to call for metal lath as a protection over furnaces, behind stoves, around chimney breasts and on positions where the very nature of all other plaster bases made the desirability of metal lath most apparent.

As the fire prevention societies began studying these questions, they immediately took up the recommendation of metal lath and have consistently carried these recommendations out in their writings. However, the dependents upon metal lath, and its relative superiority over other lathing bases was largely a matter of experience in the field where many notable instances were encountered in which metal lath stopped fires. It was also largely based upon "horse sense" from a knowledge of the material itself, its incombustibility and its ability to hold the plaster in place with the minimum of cracking and the maximum of bonding or keys.

As the expense of testing materials for their resistive features is so great, the building fraternity has been denied scientific comparison between materials and even today the published information on tests, is inadequate and there is not anywhere an unbiased list of the actual duration under standard fire test conditions of even the materials which have been tested. It is, therefore, very timely and I am very glad to be in a position to announce for the first time, the results of a series of tests at the Underwriters' Laboratories on metal lath and plaster and stucco.

Before going into detailed information on this, however, I wish to make a few observations: Considerations of fire resistive qualities of various constructions are based upon several factors. The insurance company which bases the insurance loss has different considerations to weigh from those of the building official. The building officials' consideration is primarily safety to life and secondarily safety to property. The underwriters must consider first of all the question of minimizing the spread of fire within its place of origin, so that the dollar and cents loss will be low, but they are also just as much concerned with the salvage value of the property. Therefore, they have always given a greater consideration, (by lower insurance premiums), to the masonry wall building than to the frame wall dwelling, even though the interior construction may be identical.

In fact the latest statistics indicate greater percentage of fires in masonry walled than frame walled buildings of the same inferior construction. The underwriter has also been justified in this by the factor of communication of fires, —not so much from a question of the actual communication of the fire as from the question of the greater damage to painted siding than to masonry if a fire be in the vicinity. For if the fire is really severe, it will enter by the unprotected windows anyway. The lower insurance rate on masonry has lead many people to ... greater security from fire in a masonry than in a frame house when, as a matter of fact, they are about equal as regard to safety to life, which is the building official's prime concern.

Perhaps safety from communicating fires is not far from equal, if the masonry walls do not have protected window openings. This has been demonstrated in a very spectacular way in the recent ten million dollar fire in Chicago, where the communication was largely through unprotected openings in heavy masonry walls and finally reached the first-class "fireproof" Burlington office building where the interior damage was about the same extent as it would have been in any other kind of building.

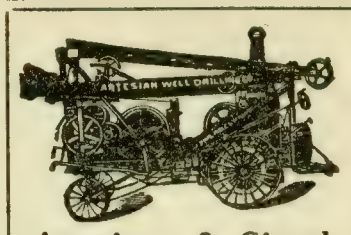
In fact, the general misunderstanding as to the superiority, from a fire protection standpoint, of masonry walls over other walls, led to a very kindly note of caution to the Brick Manufacturers by Prof. I. H. Woolson, Consulting Engineer of the National Board of Fire Underwriters, at one of their annual conventions. Prof. Woolson said in part:

As usually constructed, I doubt if the average brick building as a whole has a fire resistance of over 10 per cent. of that of its walls. This is discreditable to our engineering and architectural intelligence, and productive of shameful economic waste of manufactured resources.

I hope to win your aid in securing the introduction of such proper construction straws into brick buildings as will make them really efficiently fire-resistive.

Let me say, right here, that the defects which I shall criticise are by no means peculiar to brick buildings. They are just as prevalent in hollow tile, stone and concrete buildings.

Millions of bricks are used each year in buildings of simple architecture and modest cost. They are undoubtedly less liable to complete destruction by fire than wooden buildings, but are by no means as fire-resistive as they should be, nor are they as safe as the public is taught to believe.



Let us give prompt praise to the brick industry for their co-operation. The Common Brick Association issues a pamphlet with each one of the plans which they sell, stating as follows:

It is not the intent of those advocating brick side walls to give a false sense of safety to the occupants of such a house. The interior partitions, the floors, the roof and basement ceilings are all subject to attack by fire, and the most in-

TRUSCON Agatex HARDENER

BOOKLET ON REQUEST

Shipped as dry Crystals, for making Concrete Floors Hard as Iron

THE TRUSCON LABORATORIES —

HARDENED CONCRETE FLOORS DO NOT DUST

It is not necessary to put up with dusting cement floors. Over night a soft cement surface from which the cement dust can easily be scratched with the toe of the shoe—can be transformed into a hard, impenetrable floor that will not "sand" or crumble, even under the hardest foot traffic. Phone or write us for information.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., December 13, 1922. Sealed Proposals will be opened in this office at 3 P. M., January 5, 1923, for interior painting, finishing, etc., of buildings and structures, as listed, for the United States Veterans' Hospital, at Perryville, Md. Specifications may be obtained at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 808)

cipient start in these parts usually results in complete destruction of the interior of the house and all its contents—and too often takes human lives. More than 23,000 persons lose their lives by fire every year in America.

The home builder thoughtful enough to take the first step toward safety by building solid brick exterior walls should know how he may protect the most vulnerable spots inside his home by the use of metal lath.

Once the flames eat through the interior plaster on ordinary bases, wood partitions become flues for the flames. With metal lath as a plaster base, the fire is stopped and cannot get between the two surfaces of the walls or partitions. A wood-bearing partition especially needs good protection, for its failure means the collaspe of the floors above.

The Face Brick Association also say in their manual:

Having built a face brick house for your client, as the most substantial and attractive construction to be had, protected on the outside with a roof of permanent material and on the inside with fire-resistive material at the weakest points, you have given him the best value for his money, in a structure at once beautiful, enduring, economical and safe against fire.

It is thus recognized that interior construction must be given more attention before ordinary construction can be considered fire-safe. This idea is reinforced by the statistics recently developed by the National Lumber Manufacturers Association in which they analyze the number of fires occurring during the year 1920 in the eighty-three (83) largest cities in the United States. They found that only 1.1 per cent. of all fires extended to the adjoining buildings; that only one-fifth of 1 per cent. extended beyond the adjoining buildings, and that 98.7 per cent of all fires were confined to the building or place of origin. Furthermore, the loss by communicated fires was but 7 per cent. of the total loss.

I do not believe in one of their principal conclusions, however, that because there were more fires in brick and stone buildings than there were in frame buildings in proportion to the number of fires in each, that such information is good evidence to conclude that if people live in masonry houses they are more careless than if they live in frame houses. However, if such a conclusion is true, then the reinforced stucco frame house would be the ideal house, for the occupants would take the greatest precautions for fire safety, and the exterior would provide all the resistance to external exposure that unprotected windows in any type of wall will develop.

We cannot count upon a chain for any greater strength than its weakest link, and we cannot count upon a building wall of any material to prevent fires passing through unprotected windows. However, going back to the actual figures, we find that only 1.1 per cent. of the fires are communicated to the adjoining buildings anyway, and we had much better concern ourselves with fire protection to prevent the 98.9 per cent. of the fire hazard

than concentrate attention upon the communicating fires.

I have always contended that if fire resistance is essential for exterior walls, we should not camouflage the issue and pierce those walls with unprotected openings. If the danger is not great enough to warrant protected openings, it is not great enough to warrant restricting the choice of the prospective builder by law to a masonry wall on the basis of fire protection. If masonry can be proved to be more economical than reinforced stucco in the long run, or more attractive, as it is to many people, it should be chosen on that basis, and as a matter of fact, is chosen on that basis in most cases. However, if the owners wish is for reinforced stucco on frame, he should not be deterred by Ordinances. Officials know that stucco on metal lath has withstood the requirements of the one-hour test, you can feel perfectly safe in permitting this construction for residential occupancy in any location where unprotected windows are permitted. It is customary, however, to restrict the use of such buildings to a space outside the fire limits, and this is not entirely justified.

However, this question of exterior walls is one of small importance when compared to the question of interior fire protection, but I merely wish to register that a frame structure can be made fire-safe from exterior fire exposure by the employment of Portland cement stucco reinforced by metal lath on wood studs.

The interior of all buildings is the prime consideration and the one which is most sadly neglected. When 98.9 per cent. of all the fires are confined within the building in which they originate, is it not well for us to give more consideration to interiors than to exteriors, and more consideration to interiors than has been given in the past?

The burning up of thousands of buildings every year is an unnecessary discredit to the economy and efficiency of lumber. One of their most ardent advocates, *The American Lumberman*, has endorsed and encouraged co-operation between the lumber industry and the metal lath industry in the use of metal lath in particular points in frame and stucco houses to make them more fire resistive, and the National Lumber Manufacturers Association has jointly sponsored the tests at the Underwriters' Laboratories which have proven so successful.

It is well recognized by building officials, fire marshals and others, and confirmed by the statistics on fires that they originate in certain specific locations, over the furnaces, in closets, around flues, etc., etc. It is also recognized that if fires do start, their existence is more dangerous if they involve a staircase, the bearing partitions or the inhabited floors, than if they merely involved non-bearing partitions, attic floors or other unimportant parts.

While no one wishes to make a compromise with safety, yet it is far better to go one step in advance than it is to refuse utterly to move forward. It would be ideal, and it some day may come to pass that all buildings will be required to be entirely of incombustible material, and lumber used only for temporary uses such as packing cases, or artistic uses such as furniture and trim. But that is a long way in the distance and people who are clamoring for this ideal realize that they are playing a long and tedious game. They are making progress, however, and every step is an advance, because here and there is someone who does wish complete fire protection.

While lumber is still an economical material, is it not better to utilize it properly than to place it under the discredit that it is now receiving? Some day all houses will be required to have all lumber adequately protected, but this step is also in the distant future. Let us then look to what is practical, inexpensive, in tune with the times, and possible of early accomplishment. Metal lath can be used in the vulnerable parts of a house at a cost of about 2 per cent.—less than the interest charge for four months' occupancy.

As previously stated, metal lath has been considered as a superior material, but how much in advance of other plaster and lathing combinations has never been known. The Associated Metal Lath Manufacturers, therefore, initiated tests at the Underwriters' Laboratories several years ago, intending to develop information as to the resistance of their material with different combinations of plaster and under different conditions of exposure. The war stopped rapid progress of this, but prior to the war, a test had been made on exterior stucco placed directly on the studs, without sheating, and back-plastered.

A preliminary report from the Underwriters' Laboratories on back-plastered metal lath and stucco construction with Portland cement indicates that:

"This finish can be expected to furnish a substantial barrier to the passage of flame into the hollow spaces back of it for about one hour when exposed to fire of the degree of severity to which stucco buildings are likely to be subjected under average exterior fire exposures.

"This finish can be expected to provide sufficient heat insulation to prevent the ignition of the wooden supports to which it is attached for about one hour when exposed to fire of the degree of severity to which stucco finished buildings are likely to be subjected under average exterior fire exposures."

In our opinion, there is not much difference between the fire resistive value of the back-plastered type of construction and the more common sheathed construction. There is a thicker coat of stucco on the back-plastered type, but the sheating interposed between the stucco and the bearing studs compensates, in a measure, for the thinner stucco on the sheathed construction. Inasmuch as the windows in either case are by far the weakest link—the slight difference, if any, between these two constructions is not an essential feature.

Informal tests have been made on common lath and Portland cement stucco and this combination loses its fire resistance in a very short time and the wood is in full flame in 10 to 20 minutes because of the communication of the heat through the thin coat of stucco to any one of the laths which can then communicate the fire on the interior hollow space very rapidly.—*Architect and Engineer.*

BEAUTIFYING OUR BACK STREETS

Back of the big drab building of the Board of Public Education, at Nineteenth and Ludlow Streets, Philadelphia, is a little group of houses that has already given a novel and picturesque turn to real estate development in the central residential district, and shown how to prevent valuable property from deteriorating into slums.

This is "Lantern Lane," as quaintly charming a community as is to be found in all Philadelphia, and located in a street where less than a year ago Negroes of the poorer class huddled in squalor and congestion.

Uber Street was its old name, an 18-foot wide thoroughfare running 105 feet from Ludlow to Ranstead Street, just west of Nineteenth. On either side were eight two-story brick houses. The tiny back yards were half filled by outhouses. There was no sewer, no plumbing, no lighting. Just a dirty, unsanitary, unsightly spot in the heart of a great city.

Then one day a man with imagination passed this alley—for it was scarcely more than that—and wondered why such a place should exist at the back doors of the big properties on Chestnut Street. As he stood contemplating the rookeries he had an idea, and from present indications this idea will result in the transformation of many a Philadelphia back street into a residential garden spot.

The man was David Coons. Not an architect, not a builder, not a real estate operator, but a manufacturer of women's underwear at Tenth and Market Streets. A man of vision, he first visualized Uber Street as transformed into an artists' colony, but later realized that it was not only artists who wanted artistic homes.

As Uber Street was one of the few

streets that had never been dedicated to the city, it was possible to secure title to the street together with the entire group of houses. Eighty-seven Negroes who had occupied the sixteen houses moved to other quarters, and after they had taken all their belongings, over fifty wagonloads of rubbish were removed from the houses, chiefly from the cellars.

Only walls and floor joists were left standing for rebuilding, which was begun last spring, and in a few months a miracle was achieved. A neatly dressed, gray-haired colored man walking out Ludlow Street the other day, stood agape in front of Lantern Lane.

"Land's sake!" he exclaimed. "De las' time I passed by here I wouldn't have lived in dat street myself, and look at it now!"

Look at it, Philadelphians, and see what can be made of the ugly spots of your city.

Here are sixteen charming little houses in the Spanish style, of white and buff stucco with colored tile inserts. Eight houses on either side of a garden walk that is flanked with tiny lawns and decorative shrubs and evergreens. At the back of the walk is a high gate, with a trellis above it. The entrance is also through a gate, with lanterns on its posts, and at every door of every house—even the back doors—are lanterns. At night the lanterns of Lantern Lane give the cheeriest touch imaginable to this little colony.

Small ornamental iron balconies and hand rails and bright brass and copper trimmings add to the attractiveness of the fronts. And finally, doors and shutters are painted in bright red, yellow blue and green! The effect is not garish, but delightful.

When you enter one of these houses you step into a combination living and dining room, with a kitchenette in the rear. On the second floor are two bedrooms with a bath between. The cemented cellar can be used for storage purposes or as a den or other room. A service court in the rear affords light, air and cheerfulness.

Heat and hot water are supplied from a central plant, and there is a janitor and maid on the premises. It is really a form of apartments, with each tenant having a home of two floors and basement.

So much for the aesthetic side of the undertaking. Lantern Lane stands as a shining example of what can be done to beautify our dirty little back streets. But, many people will ask, does it pay in dollars and cents, as well as in healthfulness and civic pride?

It does pay, and the best evidence that it does is the various other operations now under way to accomplish somewhat similar results.

When Mr. Coons bought Uber Street, lock, stock and barrel, the houses rented for $12 a month. The houses in Lantern Lane rent for $100, $110, and $120 a month, and practically all were taken some time before the operation was completed.

Now that the practicality and profitableness of developments of this nature have been proved, it is plain to be seen that Lantern Lane is to be the forerunner of a whole series of such operations.

Mr. Coons himself is already planning another one on a much more elaborate scale and in a much more exclusive locality. This project is the building, in a large area south of Walnut and east of Twenty-second, of an "English Village," with rows of gabled houses of the type usually found in the suburbs, facing on a central driveway bordered by grass and evergreens.

It is the reclaiming of the back streets, however, that holds the greatest interest and the greatest possibilities. The construction of artistic homes where unsightly rattletraps have stood. The installation of sanitary conditions in localities which have been breeding spots for disease. The increased valuation of property and the elimination of an objectionable feature particularly flagrant in this city—the abutting of ill-kept and often unclean rows of small houses on the most desirable central residenes.

A splendid example of this sort of improvement is the work now going on in Panama Street for Senator Pepper. Panama Street is between Spruce and Pine and the block between Nineteenth and Twentieth Streets has long been occupied by Negroes.

Both sides of Panama Street are being remodeled into attractive homes. In many cases two single houses are being converted into one double house, as is going on in other parts of the city.

In a number of the smaller streets contiguous to the better residential district, improvements of this nature are being made by private owners. The most popular method is to take two small single houses, each with a 16-foot frontage, and convert them into a double house with a 32-foot front. Because of the low ceilings, these houses are much easier to heat than the old-fashioned high-ceilinged homes and they furnish more cosily.

On the southwest corner of Sansom and Van Pelt Streets, a group of ugly little old brick houses is being converted into picturesque Spanish type of homes of stucco, with iron balconies and colored tile ornamentation. These houses are known as "Sansom Gardens."

The "Garden City" idea is not merely applicable to a city's suburbs—but the foregoing shows it can likewise contribute to municipal progress in the heart of a great city.—*The Corn Exchange.*

WHAT HAPPENS TO STANDARDS

We find reports which indicate that a few in the brick industry prefer to make brick in sizes that are larger than the standard, but this is not the thing that usually happens to standards, nor is it as objectionable as things which more commonly happen.

The more common trouble in connection with standards is the disposition to slight them either in the matter of size or quality and thus bring ill repute upon the whole industry. We have a graphic illustration of this in the lumber industry where at one time the standard thickness for dressed inch boards was put at seven-eighths. Members of the trade kept slighting this, partly by design and partly by dressing stock before it was thoroughly dry so it afterwards shrunk to less than standard thickness. This continues until eventually there was a revising of the standards and thirteen-sixteenths was adopted. Today there is an aggravating disposition to make boards dressed to three-fourths and this is causing some agitation in the lumber trade because it means another lowering of the standard.

In the clayworking industry we have had some examples of slighting the weight and quality of the standards set up in hollow building tile, which has caused trouble and must be corrected or it will bring the whole industry into disrepute.

In the matter of brick it is the same thing. We will eventually have to guard against making stock smaller than the standards set up. The few who make oversize are not harming the industry like those who may claim to be making standard and get the habit of slighting it until others follow suit and we have in the brick industry a repetition of what has happened in lumber.

Let us make the standards in brick and hollow building tile have a real meaning by faithfully following them both in the matter of sizes and other requirements in the standard specification.—*The Clay Worker.*

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Our employers do not decide whether we shall stay where we are or go on and up; we decide that matter ourselves. Success or failure is not chosen for us: we choose them for ourselves.—H. W. Mabie.

As The Editor Sees It

CHRISTMAS, 1921, was merry because of the great volume of building work at that time in preparation for 1922. If our readers will remember we spoke of a delightful surprise awaiting us Christmas morning when we awoke to find our stocking filled with many and various kinds of plans for prospective work. Practically all the buildings looked forward to at that time have been started, and who will deny that 1922 has brought forth the greatest building boom this country has ever experienced. We can be merry again this Christmas as there is a large volume of work in sight for 1923—the war memorial building for the city to cost a few million; the twenty-four story office building to be erected at the southeast corner of 15th and Chestnut Streets for the Chestnut Street Realty Co.; the million dollar Jeanes hospital for the northeastern part of Philadelphia; the sixteen story office building for the Insurance Company of North America to be built at 16th and Arch Streets; the City Hall annex to be built at Broad and Race Streets; the fifteen story office sales building for the Cunningham Piano Co., to be built at 1312-14 Chestnut Street; the St. Joseph College Buildings on the city line; the group of buildings for Episcopal Divinity School in West Philadelphia; the enormous school programme for the City and many parochial schools; the College of Pharmacy to be built in West Philadelphia; large office building on northwest corner of 16th and Parkway; theatre and office building at northwest corner of Broad and Locust Streets for the Stanley Company; a large sales and service building to be built at 31st and Market streets; many new Churches and a volume of residential work.

The revival in all lines of business and the better feeling existing between employers and employees certainly presents sufficient reason to be merry. Labor has had a busy year and if the worker will keep on the job and not make demands for increases in wages that cause the building public to rebel at high prices, everything will move along smoothly for another year. The greatest cause of happiness is unselfishness, and if the other fellow's views are given consideration, and the golden rule observed more generally by the building fraternity at large, then the merry Christmas spirit will continue throughout the new year and the result will be not only a happy but prosperous 1923. The *Building Age* in commenting on the close of a prosperous year in the building trades in 1922 says:

This month brings the year 1922 to a close and everyone in the building industry has reason to be thankful that they have had such a prosperous year.

More building has been accomplished than in any other previous year of the history of the United States, and it is with great satisfaction that builders can survey the work that they have done as they realize that this work has been something that will add to the permanent wealth of the country and the happiness of quite a large number of families.

The man that owns his own home is a better citizen all around than one that simply rents a few rooms and it is by builders preaching this gospel of owning your own home that has made many to want and strive to build a home of their own.

There is certainly satisfaction in doing a good piece of work where it benefits yourself, your customer and your country.

The Lumber Trade Journal in discussing the round-up of the passing year and the prospects of 1923 says:

At this, the time of year for casting up the annual accounts, it is of value and interest to sum up the total of current comment as an augury for 1923. Apparently, it has been a twelve-month's era of admitted benefits in the whole, with lively expectations and actual promises of more to come. The prosperity experienced has not been the greatest ever, but in the main neither has it been confined to any one part of the lumber business or to one or a few kinds of lumber, but pretty generally distributed over all the list so that there appears no pressing need to specify kinds or otherwise particularize but to make it a lump-sum definition and inclusive.

BLUE PRINTS

Neither has the demand apparently been confined to any special part of the country but pretty generally as well as generously distributed over all, which is the wholesomest sort of an indication. But a large part, perhaps the major part, has been individual building of the home sort or small business character; no large industrial as a rule. This also should be matter for encouragement. With business going at such a pace by hopping along on the one foot of individual building, as one commentator has picturesquely put it, the future, early after the first of 1923, may well be imagined when we get going once more on all four good legs, like a work-horse, and with feet planted firmly on the ground in view of accrued benefits and the prospects of others to follow. The psychology of it, in short, is right now all to the good. The general state of mind, in other words, bad or good, respectively, hinders or helps. Anyway, it is a pointer. Hence the annual round up.

If you will discount by as much as 50 per cent. the ambitious building programs you hear tell about in almost any city of the land, either large or small, and in response to insistent needs and demands, you will still have a realizing sense of something in store that is quite worth while. It means good lumber business, apparently not only for the coming year, but for several years to come.

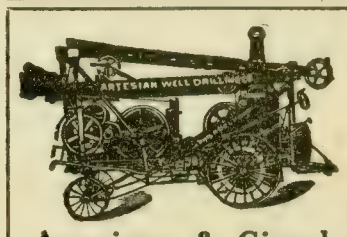
AS the demand for schools is increasing everywhere and the volume of school building grows larger almost daily, greater attention should be given to design and construction of schools. Nothing is dearer to the hearts of man than children, nothing more important to the building up of citizenship than proper care and training of children. What then could be more worthy of thorough consideration and more vital to the country than sound, sanctuary and safe schools. "Make the school house safe" in "Safeguarding America against fire" is most praiseworthy and quite timely. This valuable paper continues:

It is high time that American business men gave some consideration to the subject of fire-safety in the schools which their children attend, since the record proves conclusively that conditions are decidedly dangerous.

Perhaps it is not realized that more than one-fifth of the population of the United States—that vital portion which represents the nation's future hope—is spending several hours a day, for approximately 200 days each year, in school houses which, in literally thousands of cases, present fire hazards that would not be tolerated for a moment in a progressive business establishment. There is nothing in this of rhetorical extravagance; it is regrettable and sober truth—the more regrettable because the situation has been pointed out so often and yet is allowed to continue. The Committee on Safety to Life, of the National Fire Protection Association, has declared that fully 90% of all school buildings are veritable fire traps; and the Association is in the habit of delivering only carefully weighed opinions.

Five school buildings a day, on the average, are attacked by fire; that, at least, was the showing during the five-year period of 1916-1920. Within those sixty months a total of 9,187 claims for loss or damage to school property was recorded by the Actuarial Bureau of The National Board of Fire Underwriters. These claims represented a combined property loss of $26,302,479. Furthermore, one independent authority has noted that during the months of November and December, 1921, and January, 1922, there were thirty-one fires in which a school-building was completely destroyed. Scores, of course, during this time, were more or less severely damaged, so that there is no indication of a let-up in the school burning rate.

Statistics covering the annual loss of life in school fires are not available, but it is known that in the aggregate the number of fatalities is large. Unfortunately, it is only after a particularly staggering holocaust, such as occurred at Collinwood, Ohio, a few years ago, that nation-wide attention is focused upon the school fire hazard; and local attention, in all too many cases, is paid to the subject of safeguarding school property only when an outbreak serves to uncover some error of construction or administration more than usually flagrant—particularly when the error results in loss of life.



As a matter of fact, in the face of this appalling average of five school fires a day, one factor, and only one, has kept the number of fatalities at all within bounds. That factor is the admirable practice of holding school fire drills. Thousands of children, from one end of the country to the other, owe their lives to this training in orderly escape. Frequent fire drills, it goes without saying, should be made compulsory in schools. No longer ago than October 31, last, 1,250 pupils and 46 teachers in the New Utrecht High School, Brooklyn, N. Y., marched to safety as a result of previous practice, when fire, starting in the attic, made evacuation necessary. Scarcely a day passes that the school fire drill does not demonstrate its value over and over again.

Yet, at their best, fire drills must be considered simply as supplementary measures. They are not a cure, but an evasion; they do not remove the unhealthy

(Continued on page 833)

TRUSCON Agatex HARDENER

BOOKLET ON REQUEST

Shipped as dry Crystals, for making Concrete Floors Hard as Iron

THE TRUSCON LABORATORIES —

HARDENED CONCRETE FLOORS DO NOT DUST

It is not necessary to put up with dusting cement floors. Over night a soft cement surface from which the cement dust can easily be scratched with the toe of the shoe—can be transformed into a hard, impenetrable floor that will not "sand" or crumble, even under the hardest foot traffic. Phone or write us for information.

Brick, steel, fireproof, 2 stories, 380x410 feet, slate roof, hardwood floors, hollow tile, metal lath, safety treads, roof ventilators, marble and terrazzo work, rolled steel skylights, iron stairs, ornamental iron work, terra cotta, waterproofing and dampproofing (heating, plumbing and electric work reserved), swimming pool and gymnasium.. Will be ready for bids January 2nd.

New Jersey Contracts Awarded

Building (alts. and add.), Broadway and Kaighn's avenue, Caden, N. J. Architect, private plans. Owners, Harry Murocke and Dr. William Lashman, on premises. Carpentry, mill work, cement work, plate glass, hardware, metal ceilings, painting, glazing, iron work, sheet metal work. Contract awarded to Potts Brothers & Cooperson, 1016 Cherry street.

Factory (add.), Fair street, Trenton, N. J., $14,275. Architect, private plans. Owner, Harry Entin, 163 Fair street, Trenton, N. J. Brick, 1 story, 49x75 feet, slag roof, concrete floors, electric lighting. Contract awarded to J. H. Morris & Co., 211 North Montgomery street, Trenton, N. J.

Residence, Maple street, Trenton, N. J., $6,000. Architect, private plans. Owner, Leslie Harris, Trenton, N. J. Frame, 2 stories, 22x30 feet, slate roof, pine floors, electric lighting. Contract awarded to W. H. Leese, Trenton, N. J.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., December 19, 1922. Sealed Proposals will be opened in this office at 3 P. M., January 15, 1923, for extension to the United States Post Office at Niagara Falls, N. Y. Drawings and specifications may be obtained from the Custodian at the building, or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 824)

condition, but merely reduce the consequences of fires that never should be allowed to occur.

While the financial loss and the interruption of school work are both highly important, the most serious feature attending school fires is, first and always, the possibility of loss of life among the pupils. In the Collinwood school disaster previously referred to, 173 children lost their lives, and in the Peabody, Massachusetts, parochial school fire, six years ago, 21 girls were burned to death. There are two of the more conspicious instances where the loss of life was heavy.

How Civic Organizations Can Help

In its local application the subject of school fire-safety is one that deserves close investigation by women's clubs, chambers of commerce, and other civic organizations, for where there is concerted and determined action of this kind, hazards will be corrected. For example, the Parent-Teachers' Association of a Tennessee town not long ago demanded fire escapes for two frame school annexes. Its ultimatum declared that if fire escapes were not installed the members would withdraw their children—sixty of whom attended classes on the second floor—from the school. The board of education at first refused to accede to the demand of the Association, presumably upon the ground of expense, but finally was forced to comply. Again the Mothers' Club at Trenton, New Jersey, succeeded this year in having fire doors installed to close off the stairways of the Jefferson School of that city. Moreover, due to the Club's agitation, fire towers were incorporated in the specifications for the new wing it is proposed soon to erect.

What was accomplished in these places by concerted and articulate demand may be paralleled in other communities where school conditions are hazardous. It would seem necessary only that residents, especially parents, realize the seriousness of conditions for action to follow. Too often, educational authorities do not realize the fire hazards that exist in the schools under their supervision, although such dangers are glaringly apparent to the eye trained to detect shortcomings that make for fire. Many boards of education, trustees, and similar bodies concerned with school administration permit an otherwise commendable desire for economy to lead them into omitting features of construction and maintenance

that do not seem to them vitally needful. This plea of community poverty is probably the most common one. It should be realized that in its essence such a plea is one of dollars against children's lives, and that all too frequently a catastrophe sooner or later occurs. Economy, when it means endangering life, is not merely undesirable; it is reprehensible.

There is no denying that the past few years have witnessed some improvement in the construction of new school buildings, in the remodeling of old ones and in the institution of various safeguards. This improvement is due almost entirely to the earnest preaching of fire prevention engineers; but as yet hardly more than a start has been made. There is noticeable in many quarters a growing consciousness on the part of public officials and civic groups of the urgency of school fire-safety; and this awakening undoubtedly is to be taken as an earnest of future action. New Orleans, certainly no worse in respect to its school situation than hundreds of other cities, installed automatic sprinkler systems in all units last summer. Where the work for any reason had been delayed, not a child was permitted to enter a school building until the installation was completed and the system functioning.

Building for Safety

Planning a school building for a large city, where available land is expensive and limited, is, of course, a problem totally different from that of planning one for a small city, a suburb, or rural district. In the latter case, it is possible, and therefore always desirable, to select a site open on all sides so that there shall be no exposure hazard. The fifth largest loss in the tabulation of causes shows that $1,286,437 was occasioned by *Exposure*. If there is any likelihood of fire communicating from neighboring buildings, special protection should be provided in the way of metal-framed wired-glass windows, or metal shutters constructed according to approved specifications. Such protection usually is desirable in congested city districts. It goes without saying that schools never should be erected in proximity to an especially hazardous occupancy.

Where sufficient ground is available, the one-story building is considered ideal for school purposes, since there is no need for stairways or fire escapes and it is a simple matter to have exit doors in each class-room opening directly upon the street or surrounding grounds. The city of Rochester, New York, has built a number of one-story school houses, with saw-tooth skylight roofs, patterned on the modern style of factory architecture.

Exits Should be Primary Consideration

The detailed construction of the building itself is a subject for careful study and one on which the best professional advice should be sought. In a general way, it may be stated, however, that schools of a single story need not be of fire-resistive construction in order to be safe, provided, of course, that there are individual room exists in the outer walls. Even two story structures seldom need to be of fire-resistive materials if the floor areas are moderate and adequately protected exits are provided. Schools of three stories and over in height, though, should be of the most improved fire-resistive construction, with divided horizontal areas and with stairways and all other vertical openings properly protected. At least two stairways, located in different parts of the building, are essential for a high degree of safety. These stairways should not be more than four or five feet in width, as this is sufficient to allow for the descent of a double file of pupils. A wider stairway, enabling children to crowd to the center, frequently will cause tripping and consequent injury. Stairways should be broken at intervals with broad landings, and should be equipped with a stout hand rail at either side. These should be reached by wide and well-lighted corridors, free from lockers, chair, cabinets and other obstructions. It is vitally necessary to have all school doors open outward and, in case of class-room doors, in the line of flow towards the stairways.

The reason for the terrific rapidity with which many fies spread, irrespective of occupancy, is that stairways and other vertical openings are not inclosed; this, of course, in addition to the combustible nature of the materials used, the contents, and the existence of large, unbroken horizontal areas. Schools that have elaborate wooden trim, and wide, central wooden stairways might almost be said to have been built to burn, especially if cellars and attics are allowed to serve as catch-alls.

Fire Escapes

Virtually all fire prevention engineers agree that the school building of ideal construction, with ample stairways of proper width and protection, needs no exterior fire escapes. They hold, indeed, that the majority of such escapes are too narrow and too steep, so that descent, even without the excitement of actual fire, is perilous for small children. Often, too, they may be reached only by climbing over window-sills, and frequently they terminate a number of feet from the ground, sometimes directly over a cellar stairway or similar dangerous opening. When covered with snow and ice, they are especially hazardous and, furthermore, they are likely to pass windows of plain glass through which, in the event of fire flames and smoke may be pouring. But if exterior iron fire escapes, even when they are the best of their type, do not offer an ideal means of egress, what shall be said of exterior escapes made of wood such as do exist on small schools!

The spiral iron fire escape, whether with steps or of the chute variety, found upon so many schools in Ohio when they were inspected last Spring by State Fire Marshal Dykeman—and doubtless extensively employed elsewhere—are not to be recommended, since they are likely to result in confusion, at best, and during the excitement attendent upon fire, may cause injury and possible loss of life, especially where small children are concerned.

California, in recent years, has been experimenting with a new kind of fire escape, somewhat similar in design to the wooden slides seen in amusement parks. The fire escape chute is constructed of sheet metal and terminates in a pile of sand. Near the terminus there is an upward curve that retards the speed of descent. Pupils are encouraged to use this chute during recesses in order to familiarize themselves with it; judging by the nature of the device, it is likely that they may require little urging. There seems to be a real danger in this means of escape, however, because, under fire conditions, there is apt to be piling up at the base, with consequent injury. Even where this possibility has been eliminated, unless the chute is covered, it is quite unsuited for a severe climate and is, in general, scarcely to be recommended in place of the tower stairway to which reference will be made.

Some communities have tried ramps or inclined ways as a means of exit for their schools. However, most authorities, while favoring them for hospitals and buildings housing adults, frown upon them for school use. It is a natural tendency for children to run pell mell down any kind of inclined way, and it is feared that in time of fire pupils would be apt to get beyond the control of their teachers and sustain injury. Stairways, on the other hand, are no novelty to children; they are accustomed to using them and while doing so are under the close supervision of their teachers.

The Smoke-proof Fire Tower

By all odds the safest form of exit for any building is the smoke-proof fire tower, which is simply a built-in stairway, with fire-resistive walls and doors cutting it off from the rest of the building and from the possibility of smoke and flame. Such stairways, being storm-proof, can and should be used for daily service as well as for emergency exits, in order to accustom the occupants of the building to their use. Needless to say, all stairways should be kept clear of obstruction.

Generally speaking, if more than three

or three and one-half minutes are needed completely to evacuate a school building of moderate height it is time to do a little investigating to determine the cause of delay. While it is impossible, though, to lay too much stress upon the importance of holding fire drills at least twice a month, perfection of drill is apt to come to naught if fire exits are omitted or improperly designed, or if doors are carelessly allowed to remain locked. The loss of twenty-one lives in the fire at Peabody was due largely to a locked door. This factor also was present at Collinwood. Recently, the fire chief at New Brunswick, New Jersey, discovered two locked exit gates at one of the public schools, while it was in session. Another building just completed and popularly regarded as a model of school construction, has stairway cut-offs constructed of wired-glass set in *wooden frames,* rendering the wired-glass completely useless as a protection from fire exposure. In fact, this condition is comparable, in a way, to that found in a school building in the Central West. Here the stairways were equipped with iron hand rails and wooden treads!

Monthly fire drills are compulsory in many states for schools over one story in height, but such statutes usually do not affect colleges or universities. New York State requires a monthly fire drill in every school over one story in height and housing one hundred or more pupils. Failure on the part of principals to hold drills is punishable by a maximum fine of $50. Following every fire drill, after the pupils have completed their exit, the roll should be called. How valuable this practice is, was clearly demonstrated at the Wellesley College fire, in March, 1914, where the roll call revealed the fact that eight girs were missing. Search was made for them and they were rescued.

There is little doubt that class-room study of fire prevention, besides exerting a beneficial influence upon the home habits of American school children, has had, and will continue increasingly to have, an effect in reducing the number of school fires—at least that proportion which is due to carelessness among the pupils themselves. The 800,000 copies of *Safeguarding the Home Against Fire,* now in use, are playing no small part in this.

The Janitor An Important Factor

A fertile source of school fires is the carelessness or ignorance of janitors in tending the heating apparatus and in disposing of the always large accumulation of waste paper, broken equipment and other rubbish. It will be noted that Stoves, *Furnaces, Boilers and Their Pipes* led all other causes of school fires, during the period under review, in point of financial loss involved. This is a cause at least partly within the control of the janitor. He is an important factor in the school situation, more important than is generally realized, and he should be made thoroughly acquainted with the vital need for careful housekeeping, attentive operation of the heating plant, and strict watchfulness over everything in the building that may contribute to the outbreak of fire. It would be productive of beneficial results if school principals and boards of education made it their business to instruct janitors minutely in the removal of such hazards as lie within a janitor's control. He should also understand the use of the fire extinguishing devices with which every school should be equipped. The janitor should be charged with the duty of making periodic tests of the interior alarm system. In case of fire, the alarm should be sounded and the fire department called before any attempt is made to fight the flames.

During recent years many courses have been introduced into the grade and high school curricula which increase the fire dangers. Among these are domestic science and manual training. They make necessary especial watchfulness. Electrical engineering and chemistry likewise present their own peculiar hazards, not to mention the cafeteria which is becoming such a popular adjunct of the modern school. Also, in most cities, school houses are utilized for meetings, educational lectures and similar gatherings, all of which add to the lighting and heating, as well as to the *Matches-Smoking* hazard. Smoking in the building during evening entertainments has caused no small number of school fires, as the records of the Actuarial Bureau attest.

Little need be said about the specific causes of fire. The six leading causes are: *Stoves, Furnaces, Boilers and Their Pipes; Electricity; Defective Chimneys and Flues; Spontaneous Combustion; Exposure (including Conflagrations)*; and *Sparks on Roofs,* in the order named. It was reported that a defective flue, for example, caused the destruction of the main building of the New Mexico Normal University, at Las Vegas last February. A library collection numbering 8,000 volumes, and many archaeological specimens, also were lost in the fire. Spontaneous combustion of soft coal, stored in the furnace room, was held to be responsible for the razing of the Colored State Normal School at Jericho Park, Maryland, last month. It would be an easy task to compile a depressingly long list of school fires brought about by each of these causes.

Incendiarism was not the least serious fire cause. Almost a million dollars' worth of school property during the period of 1916-1920 was destroyed in this criminal manner. Demented pupils are undoubtedly responsible for most of this intentional destruction, as was the case, for instance, at Pine Bluffs, Wyoming, and at Worcester, Massachusetts, at the beginning of the present year. Boys fancying themselves unjustly punished or discriminated against have set fire to more than one school. Desire for an immediate vacation led a student in one of the country's leading military schools to burn the administration building a year or two ago.

Careless workmen employed in and about school property are responsible for an untold number of fires. In September, last year, the Junior High School at Hood River, Ore., was destroyed through what was reported as the careless handling of a blow-torch by one of a crew of plumbers engaged in installing a hot-water heating system. The burning of one of the public schools of Albany, New York, was ascribed to carelessness on the part of workmen who were repairing the roof. Many similar instances might be cited.

The Combustible Roof

Combustible roofs, especially the wooden shingle, should no more be found on school houses than on hospitals. But that they still are present in large numbers is proved by the loss record of *Sparks on Roofs.*

Keeping school houses constantly in good repair will not only reduce the likelihood of fire but also constitutes a sensible measure of economy. This seems obvious enough, yet, in a personal inspection last spring of Buffalo's schools, Mayor Schwab found in one unit a leaky roof which, according to his estimate, could have been repaired five years ago for $32. Today, according to the Mayor, it will cost the city about $1,100.

With few exceptions, the country's schools at present are over-crowded—in many cases far beyond the point of safety. During the War, of course, school construction did not keep pace with the growing needs of communities, and this condition also has contributed to the prevalence of school fires. The board of education of Wilmington, Delaware, sought to overcome this congestion by erecting two portable school houses. Fortunately, the city building inspector did not allow it to get beyond the stage of a proposal. Temporary construction is as unsatisfactory as it is dangerous; the only way in which the situation can be effectively relieved is by a program of permanent building.

Often it happens that in communities hard pressed for funds with which to construct and maintain schools there is inadequate insurance upon existing school buildings. Last January, Boonville, New York, lost its high school through fire. Although the building originally cost $45,000, it was estimated that to replace it would cost $125,000; and only $17,000 insurance was carried. Likewise, the

tax-payers of San Francisco will be saddled with an additional levy, perhaps exceeding $200,000, if they replace the much needed Mission High School, which was totally uninsured when, recently, it was destroye. On Feb. 5, this year, the State Teachers' College at Mankato was destroyed by fire, with a loss of $500,000. The property was insured in the State fund which, however, was insufficient to cover this one loss.

The case for safe school houses has been summed up admirably by William B. Ittner, of St. Louis, who, in speaking on school construction before a recent annual meeting of the National Fire Protection Association, said:

"School buildings are the most important structures of any type, for it is here that character and citizenship are moulded, and a building of questionable safety is not only a poor investment but a reflection upon the intelligence of any community which erects or maintains it."

THE PROBLEM OF TRAINING BRICKLAYERS

Reports in hand indicate that a recent survey made by the Associated General Contractors of America shows that although we have had a great increase in population and in the extent of building operations there are actually less skilled men for this work today than there were ten years ago. The report says that in bricklaying and plastering the number now engaged is 21 per cent. less than in 1910, and that to maintain a proper balance with the increase in population and in building activity we should have an increase of 36 per cent in the number of bricklayers and plasterers.

Plainly one of the serious problems of the day is how we may go about it, how we may encourage enough young men to take up the calling of bricklaying, and train them so they will be properly qualified for the work. It is probable too that the matter of training will help or hinder in this depending upon how attractive it can be made. There is no question about the skilled bricklayer getting goodly returns for his labor. The question is one of how the young man may acquire this skill in a reasonable time. The young men of today do not take to the old apprenticeship idea kindly, with its three or four years of tedious toil and not much specific training. So the question hinges largely on how much we may shorten the period of training time and how much more attractive and worth while we can make it by proper effort.

There is a pretty widely expressed opinion that we should have some kind of a school-hook-up here. This idea has taken on different forms. Some see in it a call for special trade sschools; others see in it the need to either embody more specific training of this kind in our regular schools, or else develop some system by which youngsters can attend school and pursue studies part of their time and meanwhile put in a part of their time at their actual work.

Two facts stand out plainly here. One is that for a man to be a qualified bricklayer he must have some training and experience in doing the actual work. The other is that specific schooling and instruction obtained in some suitable manner is essential to the rounding out of his mechanical knowledge so that he may be worth more both to himself and to others.

One of the good suggestions in this connection, which comes from the Hollow Building Tile Association, is a recommendation that men now engaged on construction work as laborers and in other capacities who show an aptitude, be employed as helpers to the skilled mechanics, and be permitted to do any work their experience warrants. This is a following up of that good old idea that every skilled or experienced worker requires some assistance, and the assistant or understudy to the skilled worker should in time become a skilled worker himself, especially if he has an aptitude and if the skilled worker he is helping has enough interest in him to give those specific instructions from time to time which will guide him along the right ways to attain the goal of the skilled worker himself. The general introduction and use of the Mann Patent Trowel will help solve the problem.

More attention to encouraging helpers in becoming skilled workers not only on the part of the skilled workers themselves, but along another line, that of taking up specific studies which will be helpful at their homes, will contribute materially to the solving of this problem. It is an idea, too, which should be followed even though we develop more in the way of specific trade schools and more in the way of trade hook-up with our public schools.

The big things for us to keep before us all the time is, that we need more bricklayers, not only for the welfare of the brickmaking industry, but also for the welfare and service of the general building public, and finally for the good of those who serve well in this work themselves. Keeping this in mind we should seek diligently for some guiding light for ways and means which will help out in swelling the army of skilled bricklayers in each community.—*Clay Worker.*

The man who doesn't advertise because he can't afford to "do it right" will never reach a position of affluence because everything worth while in the world had to have a beginning, and there can be no "get there" for the fellow who fails to make a start.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the past two years it would interest us to know.
